## **MAINFRAME SKILLS, PAY AT A PREMIUM**

## **Experienced workers nearing retirement age**

**BY JULIA KING**  
IT managers looking to cut labor costs during the ongoing recession might want to think twice before laying off any of their workers who have main-

frame or data center skills.

With mainframe shipments on the rise and legions of traditional mainframe IT workers nearing retirement age, technology managers last week said it's becoming increasingly difficult and costly to replace employees who have deep experience in Cobol, CICS and

other mainframe technologies.

For example, the Workplace Safety and Insurance Board of Ontario is shellshing out 30% to 15% signing bonuses to new workers with mainframe skills. The Toronto-based board, which oversees workplace safety and workers' compensation issues for the province of Ontario, also pays "hot skills" premiums to mainframe experts. That can boost their annual salaries by as much as 10%, said David Lonsky, director of the board's corporate information center.

**At the Automobile Club of Southern California, a Costa Mesa, Calif.-based affiliate of Heathrow, Fla.-based AAA (formerly known as the American Automobile Association), IT manager Bill Reini said he's Mainframe Skills, page 16**

# **CA Confronts User Anger, Reveals Web Portal Plan**

Kumar talks candidly about Computer Associates' hard-nosed reputation, says CA will introduce portals for security and storage management at CA World.

BY MARY L. BORRMAN,  
DON TERRANT AND  
MARYFRAN JOHNSON  
IRVINGTON, N.Y.

Last week Computer Associates International Inc.'s headquarters here, President and CEO Sanjay Kumar spoke at length with Computerworld about CA's historically stormy relationship with

SARAH FERGUSON, CAA's president and CEO

its customers and the recently initiated federal investigations into changes CA has made in its financial accounting and reporting practices. Excerpts from that interview follow:

In light of the problems CA has confronted over the past year, what are you going to tell your users at this year's CA World? There has al-  
Kumar, page G

BY MARGIE L. BOWMAN  
SARATOGA, N.Y.

Computer Associates International Inc. is preparing to ease the pain for users running heterogeneous storage and security management applications. And CA says it will do so without forcing them to buy into its Unicenter enterprise systems management platform.

Executives last week told Computerworld that CA is readying the rollout of stand-

alone Web portal software for centralized storage and security management. The plan will be detailed at the company's annual user conference next month. CA also plans to make announcements at CA World regarding its relationship with its customers, but company officials didn't elaborate beyond conveying a strategic direction (see Q&A at left).

CA WORLD

# What Have You Done For Me Lately?

CEOs and CFOs are continually asking their IT leaders to come up with brilliant ideas for slashing costs, pumping up sales or improving productivity. Here's a look at three hard-chargers who have delivered. Stories begin on page 26, and also see related editorial, page 24.

**AT ONE TIME, DATA STORAGE  
AND AT ONE TIME, THIS**

# JUST MEANT HAVING A BOX. WAS A WICKED HAIRCUT.

## Introducing Sun's complete storage solutions. A new approach to storage that can make you look pretty sharp.

In today's complex, data-hungry IT environment, storage has to be a lot more than just a box. You need your storage to be an integrated part of your entire IT infrastructure. How are you going to get there? With complete storage solutions from Sun. By thinking about your IT infrastructure as a whole, you can reduce complexity throughout your enterprise. And with Sun StorEdge,<sup>TM</sup> this practical approach to storage now exists. All of Sun's new storage products - software, hardware and services - are part of Sun's end-to-end IT infrastructure. And all of our products are optimized for the Solaris<sup>®</sup> Operating Environment, yet open to heterogeneous environments. Everything can now work as one. And that means more utilization of your storage resources, with unparalleled uptime and a lower cost of ownership, even if you're on a multi-vendor system.

### SUN'S NEW STORAGE OFFERINGS

#### Software

With the new Sun StorEdge software suites, you have complete control over all your storage resources:

**Availability Suite:** for increased uptime and rapid recovery from disasters.

**Utilization Suite:** so you can uncover every nook and cranny of available storage.

**Resource Management Suite:** lets you proactively manage your storage capacity.

**Performance Suite:** provides quick data access, continually protected information and our new next-generation file system.

#### Systems

Our storage systems, ranging from the workspace to the data center, are optimized to fit your environment:

**New Sun StorEdge 3800 series:** delivers the best high-performance computing available.

**New Sun StorEdge 9800 series:** integrated virtualization technology lets you pool every last byte of storage capacity and share it across multiple systems, so you can consolidate all your storage resources.

**The Sun StorEdge 9600 series:** simply delivers best-in-class storage performance, five-9s availability and connectivity for your mission-critical data center.

#### Services

Sun's services team can help you build a storage environment that's custom-fit to your enterprise.

Because our focus isn't limited to storage, you can benefit from our comprehensive understanding of the interdependence between your storage, servers, software and the network.

We can also provide handy assistance on everything from general consulting and implementation to the finer points of data management planning.

Finally, because we know prevention is the best medicine, we offer Sun StorEdge Remote Response<sup>™</sup>: pre-emptive support that gives you round-the-clock monitoring of your storage.

You get everything you need to maximize your return and minimize your costs.

#### Storage for Solaris or a heterogeneous environment? Why not both?

If you're already using Sun's rock-solid servers and award-winning Solaris Operating Environment (rated the #1 OE by D.H. Brown Associates), you can be sure that Sun StorEdge is optimized to get the most out of your storage resources. And if your environment includes other operating systems and server platforms (such as NT, Linux or AIX), our open solutions will make your storage work harder and smarter.

For more information on Sun's complete storage solutions, all you have to do is take the first step. Visit [www.sun.com/sunstorage](http://www.sun.com/sunstorage), or contact your Sun representative.

**How the world's largest sporting event reached its networking goals.**

Billions of people will be watching every kick of the FIFA World Cup™. And with massive amounts of mission-critical voice and data communication generated in just four weeks, even the smallest glitch is a huge problem. That's why they chose Avaya to build one of the world's largest converged networks. Protected by a VPN firewall that blocks intrusions without slowdowns, it's one of the most secure and reliable networks available. Plus, it's all backed by our highly skilled global services team. So 10,000 voice and data devices, and hundreds of switches and routers won't be caught unguarded. For a white paper detailing how Avaya is powering the FIFA World Cup™, visit [avaya.com/worldcup](http://avaya.com/worldcup).

### SPECIAL NEWS REPORT

#### SEPT. 11: After Six Months, IT Is Key

6 Those spearheading IT volunteer efforts never want to be caught off guard again.

7 Wall Street firms begin moving their IT operations out of Manhattan to avoid a recurrence.

8 Critical infrastructure protection becomes a top priority for the public and private sectors.

10 Corporate privacy managers acknowledge that they have a long way to go to get privacy policies in place and to ensure compliance.

12 Microsoft filling a glaring midmarket hole by moving into the CRM space, say analysts.

14 Attendees at last week's BEA user conference receive promises of more tightly integrated middleware products.

## BUSINESS

27

27 Paul A. Strasmann says many methodologies aimed at calculating the alignment between IT and business units don't add up.

36 **Diversity:** Women in IT who bump up against perceived gender barriers typically take one of two approaches to the problem, writes Kathleen Melymeka. They either whine about them or see the barriers as challenges and fight to overcome them.

38 **Career Advisor:** Fran Quigley offers advice to an IT professional who is preparing for a layoff and to a veteran mainframe programmer who has updated his skills in areas such as Visual Basic and Java but has had trouble getting in the door at other companies.

38 **Workstyle:** Phil Go, CIO at Barton Malow Co., talks about what it's like to work in IT at the \$1 billion construction management firm.

## TECHNOLOGY

39

24

39 Nicholas Petreley takes a skeptical look at the impact on Web services from Microsoft's .Net initiative.

40 **Field Report:** Network-attached storage is becoming a serious top-down enterprise storage resource.

44 **Emerging Technologies:** The iSCSI standard is paving the way for IP-based storage-area networks, and the new standard will battle with Fibre Channel for data center supremacy.

46 **Hands On:** Virtual machines that can concurrently host multiple operating systems may dramatically reduce your backup equipment and software costs.

50 **Security Journal:** A token-based access system proposed by Matthias Thurman faces opposition from the network engineers at his company.

## OPINIONS

24 Patricia Kafue

says that IT professionals are being called upon to do things that are heroic — be it at work or in their communities. The big question for this year is: What have you done for me lately?

24 Penn Fox writes that enterprise portals can help the bottom line, but they aren't integration tools, and they require clear, goal-oriented planning.

25 David Fouts contends that, amid the Enron fallout, the only way to enforce ethical behavior is to hire the right people.

62 Frank Hayes says a "best practices" proposal — for telling a software vendor of a product security flaw and giving the vendor time to fix it — is itself flawed.

# Efforts Afoot to Coordinate IT Volunteer Work After Disasters

**Many tech needs yet to be addressed**

BY MELISSA SOLONIAN

**A**FTER recovering from the shock of Sept. 11, Julie Gandle decided to do her part to aid the recovery efforts.

She told a Park Avenue emergency relief center volunteer that she had 18 computers and two weeks of man-hours to donate from her New York-based IT infrastructure support firm, Work Friendly Solutions. "The poor woman looked at me and said she didn't even know how to use a computer," said Gandle.

As the devastation of Sept. 11 unfolded, IT professionals worldwide recognized the data and infrastructure implications and stepped forward to offer their expertise. But while relief agencies were ready with food, shelter and counseling services, no one seemed to be prepared to harness the collective IT manpower and put it to systematic use.

"You would think in New York City 2001 that there's a whole portable unit that can drop down in two hours with PalmPilots. That doesn't happen," Gandle said.

Within weeks, a few groups emerged to lead the business

and IT recovery efforts. With help from thousands of volunteers like Gandle, they accomplished a great deal. But six months later, many feel that much more could have been done. So IT and business leaders are now streamlining their efforts to tackle long-term needs and ensure that they're never caught off-guard again.

"It was chaos," said Maria Gotisch, director of Restart Central, an organization jointly operated by the New York City Partnership and the city and

state economic development offices to channel donated goods and services to businesses affected by the attacks. "We had every problem, every situation that a start-up has."

John Williamson, a laid-off IT worker, said he tried unsuccessfully to volunteer. "We should have had some direction, some leadership," said Williamson, who created one of many Web sites compiling volunteer opportunities. "But when you tried to step up to the plate, you got pushed aside."

In a database. They then assigned qualified volunteers to work individually with businesses to rebuild their infrastructures, explained Burke.

Julie Coppelton, technical assistant to the chairman of Intel Corp., turned over her experiences with Restart Central to a Disaster Services team to create an national emergency technology panel. Coppelton said she felt the "one-voice concept" made sense.

"Restart Central was definitely a leader. There's no question about that," she said.

—Melissa Solonian

## A Push for One Voice

Among the leg of events after Sept. 11, one call went out for James Pedder, chief financial officer at Lantech Inc., a trading-floor software firm that租用了 the 83rd floor of 1 World Trade Center.

The call was from a women of Restart Central, an organization created to help businesses rebuild after the attacks. Since then, Pedder has worked with Restart Central volunteers Alton Buske to line up office services and equipment and re-establish telecommunications

links networks. "It's really been a tremendous resource for us," said Pedder, who's still working with the organization.

Restart Central has matched more than 1,000 businesses with \$3.2 million worth of donated goods. It's still working with about 340 firms, said Marni Gottsch, the organization's co-chairwoman.

Volunteers offered assistance to those who contacted city and state emergency hot lines or walk-in centers. They gathered donated resources and entered the names of volunteers and affected companies

into a database. They then assigned qualified volunteers to work individually with businesses to rebuild their infrastructures, explained Burke.

Julie Coppelton, technical assistant to the chairman of Intel Corp., turned over her experiences with Restart Central to a Disaster Services team to create an national emergency technology panel. Coppelton said she felt the "one-voice concept" made sense.

"Restart Central was definitely a leader. There's no question about that," she said.

—Melissa Solonian

It seemed politics stepped into it pretty quickly."

Relief coordinators said the volume of assistance was overwhelming, but the offers of help far exceeded the demand. And in the first few months after Sept. 11, their attention was focused on helping those with emergency needs.

But "there are still needs," said Barbara Chang, executive director of NPWNY, a nonprofit organization that provides IT assistance to other nonprofits in the city.

A February update to a study commissioned by the New York City Partnership in November found that the economic impact from the attacks is meeting initial projections of \$83 billion in damage to the city's economy.

Many businesses are starting to move into permanent office space, build up their long-term infrastructures and apply for grants and loans, said Rosina Brown, president of The Better Business Bureau of New York, which held forums in November and January to coordinate relief efforts.

To address long-term planning, Ron Wyden (D-Ore.), chairman of the Senate Subcommittee on Science, Technology and Space, has been working to create a national emergency technology guard. His plan is to form a chain of command to coordinate the science and technology sectors to prevent and respond to disasters.

"There was such an outpouring of support," said Wyden's press secretary, Carol Guthrie. "Even more might have been accomplished if there was a clear organization in place."

Businesses affected by the attacks or those who would like to volunteer or donate equipment to businesses in need can complete an NPWNY relief form at [www.npwny.org/Index\\_re.html](http://www.npwny.org/Index_re.html) or contact Restart Central at (606) 227-0458 or [www.restartcentral.org](http://www.restartcentral.org).

## How IT Pros Helped Out

It took three tense days for Truepeak Technologies Inc., an enterprise search-and-retrieval software firm that租用了 the 33rd floor of the World Trade Center, to learn that all of its employees were safe and accounted for.

Then Truepeak's managers turned their attention to the business. Thanks to its backup plan, the firm restored its e-mail server almost immediately, and it lost only about a month's worth of software development work, said Chief Technology Officer Joaquin Ortega. But all of its equipment was gone.

Fortunately, word of IT donations and volunteers spread quickly. Several organizations, including Computerworld, created volunteer databases and passed names along to relief agencies assisting affected businesses. Since January, those who volunteered through Computerworld's database have been learning about how they helped out.

Shortly after Truepeak moved into its new space on West 25th Street, it connected with New York-based About Inc., which gave Truepeak several computers, a fax machine, a printer and even a microwave.

"They were perfect for our needs," said Ortega. "Without those computers, we would have lost a lot of business."

About, which runs an online information network, also donated spare space in its offices and gave free phones and Internet connectivity to Wi-Techologies Inc., a wireless business left homeless after the attacks, said Luc LeFevre vice president of corporate technology at About.

"The best way you can fight against what happened is to be on your feet again [and] to get the economy going again," LeFevre said.

—Melissa Solonian

# NEWSSIX MONTHS LATER

## Financial Firms Plan Widely Dispersed IT Operations

**Aiming to avoid big losses, some move out of Manhattan**

BY LUCAS MEARIAN  
NEW YORK

In the wake of the Sept. 11 attacks, financial services executives are putting more stock in employees' ability to work from remote locations using virtual private networks, and they're widening the gap between office locations to mitigate the impact of future disasters.

In some cases, that means companies are moving their offices and IT operations out of New York City and into surrounding suburbs.

Merrill Lynch & Co., for in-

stance, is moving its primary data center from Manhattan to Staten Island, which is on a different power grid, according to Marvin Balliet, first vice president and chief financial officer of the firm's technology group.

Another big Wall Street firm that's pulling up at least some of its stakes is Morgan Stanley Dean Witter & Co., which was in the process of completing a new 1 million-square-foot office tower in New York last year but sold its 32-story building to Lehman Brothers Holdings Inc. in October.

Instead, Morgan Stanley announced plans in January to purchase the former Chevron-Texaco Corp. headquarters in Harrison, N.Y., about 27 miles north of its current offices.

Gregory Ferris, executive director of global business continuity planning at Morgan Stanley, said the threat of future attacks was the primary reason for the bank's change of heart.

"We need to be able to react to a disaster... but more important is we need to mitigate the loss of a single site," said Ferris, one of the speakers at the Securities Industry Association's Internet Trends and Strategy Conference held here last week.

With its primary spaces at 1585 Broadway and 745 Seventh Ave., the firm's trading and

backup facilities would be concentrated in two buildings located within a city block of each other and dependent on the same transportation and power infrastructures.

Ferris added that an expansion in so-called dark fiber networks — optical fiber networks that aren't currently being used — is making the decentralization of staffs and

data centers easier today because of increased bandwidth.

William James, chief technology officer for Bank of America Corp.'s broker/dealer services unit, said his company is implementing a dark fiber network to connect a data center in California, Texas, North Carolina and New Jersey in a two-year, multimillion-dollar project he expects to be com-

pleted sometime next year. The network will be used for disaster recovery as well as backups.

Currently, Bank of America uses leased T3 lines at a "substantial cost" to load-balance servers among data centers for disaster recovery.

"There's a one-third reduction in cost by using disaster recovery servers for load balancing vs. having all your disaster recovery hosts in the same data center. They're there just as space heaters that aren't being used," James said. ■

## Wall Street Seeks Cyberterror Defenses

The most effective way to deal with the kind of threats posed by hackers and cyberterrorists, say many Wall Street IT executives, is to form a united effort between the private sector and government to create a dedicated communications platform to alert and disseminate information about such attacks using a private network.

A panel made up of representatives from the U.S. Secret Service, the National Infrastructure Protection Center and the Financial Services Information Sharing and Analysis Center (FSISAC) presented attendees at a Securities Industry Association cybersecurity workshop in New York last week to work toward sharing information within the financial industry and with law enforcement about potential threats and attacks on firms' technology infrastructures.

The FSISAC, a private organization in New York, charges companies a minimum \$7,000 annual fee for alerts and access to information about hacking and cyberterrorist threats. Stanley Jacobs, also president of the security engineering at Morgan Stanley Dean Witter & Co. and chairman of the FSISAC, said cybersecurity experts supported by government resources have almost unlimited resources to do damage to Wall Street's IT infrastructure.

Jacobs said firms should either join the FSISAC's service or create a secure, custom Web site through which they can share information anonymously with one another.

C. Warren Awad, director of information security at the Patching Division of Donaldson, Lufkin & Jenrette Securities Corp. in Jersey City, N.J., pointed out that the greatest

threats to financial institutions and e-mails — at least when employees were allowed to use their computers when generators were the sole source of power.

The laser beam "kept working, even through all the smoke and ash from the fallout," said Greta Ostrovitz, Cadwalader's director of technology. "Had we put in telephone lines with similar speed, it would have cost us \$6,000 per month. This [laser] cost us \$48,000 one time."

The laser was installed three years ago by manufacturer LightPointe Communications Inc. in San Diego. LightPointe's laser systems provide campus-

wide networking for distances spanning about 2.5 miles in metropolitan areas and speeds ranging from about 2M bit/sec. to 622M bit/sec.

"Maybe once or twice a year we adjust the alignment, but that takes two or three minutes," Ostrovitz said. "It is virtually flawless."

The system allows all types of networking protocols — including Synchronous Optical Network ring closures, Gigabit Ethernet access, DS3 services and Gigabit Ethernet LAN-to-LAN — to be transmitted at

at cyberterrorism threats come from "someone infiltrating your organization and using that power to do damage."

"The very first thing you want to do is to make the information available to other without threatening it," Awad said.

Todd Wheeler, an agent of the Secret Service's New York Electronic Crimes Task Force, agreed. He said almost 70% of the more than 900 people the Secret Service has arrested in New York in connection with Internet attacks are considered insider threats. He recommended that companies adopt background checks for employees based on the nature of an individual's position within the organization.

"On the backside of it is negligence, such as by insurance companies not on the hook that you didn't have due diligence or best practices in place," Wheeler said.

— Lucas Mearian

## HACKER WATCH

OSTROVITZ: Laser beam transmitted data despite surrounding debris.

full networking speeds.

In addition, the laser systems can be deployed in a matter of hours without the need for a long-term, leased wire or fiber connections.

Merrill Lynch & Co. has set up a similar data-transmitting laser pointing from its Vesey Street office towers across the Hudson River to an alternate site in New Jersey. Merrill Lynch spokeswoman Selena Morris said the laser was installed in direct response to losing communications on Sept. 11. ■

## Lasers Eyed as Medium for Disaster Communications

BY LUCAS MEARIAN  
NEW YORK

Companies near ground zero in New York learned some painful lessons in the aftermath of the Sept. 11 attacks, not the least of which is how to communicate when telephone lines and Internet service providers are down.

One answer was in the 14th-story window of the lower Manhattan headquarters of financial services law firm Cad-

walder, Wickersham & Taft on that fateful day: a small black box that emits a laser beam transmitting data at 1G bit/sec. to a secondary office site across the street.

After the terrorist attacks, New York-based Verizon Communications' phone and data lines running under the World Trade Center were cut and couldn't be reconnected for days. Meanwhile, Cadwalader's laser beam kept transmitting docu-

# Digital Destruction Was Worst Imaginable

**Extent of cyberinfrastructure devastation on Sept. 11 unprecedented, officials say**

BY DAN VERTON  
WASHINGTON

**F**OR SEVERAL hours on Sept. 11, the nation was deaf, dumb and blind due to the "absolutely massive" loss of communications infrastructure resulting from the collapse of the World Trade Center, a senior government official said last week.

While those losses pale in comparison to the human tragedy, federal and industry officials for the first time painted a frightening picture of what the terrorist attacks did to the U.S. telecommunications infrastructure that fateful day and revealed just how fragile the nation's economic digital backbone can be.

According to officials at the homeland security conference here last week, sponsored by the Fairfax, Va.-based Armed Forces Communications and Electronics Association, the collapse of the World Trade Center towers in New York inflicted severe damage on one of the most critical telecommunications nodes in the country: the main regional switching center operated by Verizon Communications at 140 West St., adjacent to World Trade Center 7, which collapsed.

The resulting devastation was "the most significant challenge that the National Communications System had ever seen," said Brendon Greene, deputy manager at the National Communications System (NCS), which is responsible for all the major telecommunications networks that have ne-

tional security significance.

In addition to the immediate wireless circuit overload, the collapse of the towers sent a massive steel beam slicing through a bundle of critical fiber cables buried eight feet below ground, destroying more than 4 million high-speed access lines and rupturing water lines that filled underground switching vaults with more than 80 million gallons of water.

The damage knocked out 1.5 million circuits that served the

Verizon facility housed

financial district, threatening the country's economic stability, said Greene.

The Verizon facility housed enough equipment to make it the "most communications-intensive area in the U.S.," said Bruce Fleming, divisional technology officer at New York-based Verizon.

## Virtual Army Fights Back

That fact wasn't lost on the Bush administration, Greene said. Once emergency response and rescue efforts were given the support they required, the White House ordered Greene to make restoring Wall Street connectivity the next priority.

Restoring the Verizon backbone, however, would require a virtual army of federal and industry technicians. Primary power had been lost, and backup power, which was running on diesel fuel generators, began to fade quickly.

Lucent Technologies Inc. in Murray Hill, N.J., one of Verizon's main systems providers, rushed a 100,000-line switch to the scene to replace another massive switch that had been sent crashing through the window of the Verizon building. The company also put all of its customer requirements on hold and made its entire inventory available to rescue services, said Greg Butler, a Verizon vice president who coordinated incident response efforts.

In addition to the damage incurred by Verizon, at least 139 fiber rings in surrounding buildings and 26 building-specific fiber rings failed, said Dick

## Lessons Learned From the Tranches

Consider how you will get replacement supplies, equipment and personnel to disaster sites when planes can't fly, bridges are closed and other transportation is unavailable.

Establish single points of failure. Handing avoided interruption in operations by distributing transaction nodes.

Distribute storage and backup data, especially configuration information.

Price, vice president of field operations at WorldCom Inc.

"From a macro level, our national security should be a major part of our telecommunications policy," said Fleming. "If it can happen, it hasn't happened yet."

# Water Systems Improve Net Security After FBI Warning

## Wireless systems vulnerable to jams

BY BOB BREWSTER

Following an FBI terrorism alert issued in January, municipal and publicly owned water systems around the country have started to boost the security of wireless data systems that control their distribution networks.

The FBI's National Infrastructure Protection Center didn't publicly release the contents of the warning, but water utility executives confirmed that they were alerted that Osama bin Laden's Qaeda terrorist network had extensively researched their systems on the Web.

Utilities, including water systems, use wireless Supervisory Control and Data Acquisition (SCADA) networks to control all aspects of their distribution systems, such as electric trans-

mision lines and substations, water pipelines, storage tanks and pumps. These networks can control myriad pumps, pipelines and reservoirs in a large water distribution system.

Jill Lyon, general counsel of the Washington-based United Telecom Council (UTC), which represents the telecommunications interests of utilities with federal regulatory bodies, said her organization has met with the Office of Homeland Defense and other agencies to discuss potential vulnerabilities in SCADA systems.

Lyon said one of her biggest concerns is the potential jamming of wireless SCADA systems, which operate in the 900-1 MHz frequency band. She said SCADA systems in that band, which is also home to cellular systems, cordless phones and unlicensed fixed wireless operators, are already subject to unintentional "friendly interference" from authorized users in the band. Because of those

## AT A GLANCE

### SCADA Security

- FBI warns of Web research by Osama bin Laden's Qaeda organization into water company data networks.
- Wireless SCADA networks are susceptible to jamming.
- Some Web sites contain maps of distribution systems and SCADA networks.
- Credit private fiber-optic nets could help remove wireless security problems.

issues, she is concerned about the ability of an adversary to intentionally jam SCADA networks, she said.

Such jamming could potentially allow a foe to turn pumps on or off, "start a fire and then shut down the water system," depriving firefighters of the water they would need to combat the fire, Lyon said.

Jerry Oberst, UTC chairman and chief engineer for the Lincoln Water System in Nebraska, said he, too, is concerned about wireless SCADA systems operating in bands allocated to the utility industry.

Oberst said water utilities might eventually be forced to encrypt all data on their SCADA systems and may have to consider shifting their

SCADA networks to private fiber-optic systems, which are less susceptible to jamming or hacking than wireless networks. Oberst said water utilities also need to remove all information about SCADA systems from publicly accessible Web sites to prevent the kind of intelligence-gathering the FBI warned about.

Shelia Streble, a spokeswoman for city-owned Seattle Public Utilities, said that in the past few months, the department has removed all information about SCADA systems from its Web site, as well as maps detailing the water system's infrastructure and details of certain capital spending projects. It currently operates what Streble described as a "low-tech" SCADA system but is developing a network with increased security requirements.

Investor-owned San Jose Water Co., which serves Silicon Valley, has also added security upgrades since September to its wireless SCADA network, said spokesman Dick Balocco.

## AT DEADLINE

### Microsoft, DOJ Revise Antitrust Settlement

**M**icrosoft Corp. and the U.S. Department of Justice (DOJ) revised their proposed antitrust case settlement in advance of a court hearing scheduled for Wednesday. Most of the changes were intended to better define terms and to clause potential loopholes. Microsoft also agreed to delete a clause that critics claimed could have given it access to technology patented by PC vendors.

### Galileo Moves Fare Pricing App to Unix

**G**alileo, N.J.-based Galileo International Inc., which operates one of the four major travel reservation systems, said it's moving its fare-pricing application from a mainframe to a group of eight Sun Fire 8800 Unix servers made by Sun Microsystems Inc. Galileo also plans to rewrite the software as part of the switch. The Unix-based setup is already being used by some of Galileo's customers.

### Security Hole Found In Linux Firewall

**L**inux developers warned that a flaw in the Netfilter firewall used in various versions of the open-source operating system's kernel could leave servers vulnerable to attack. Red Hat Inc., in Research Triangle Park, N.C., released a patch to plug the hole in Versions 7.1 and 7.2 of its Linux distribution. A separate patch is available at [www.netfilter.org](http://www.netfilter.org).

### Short Takes

**S**unray, Calif.-based Web development and hosting firm LOUD-CLOUD INC. agreed to buy Los Angeles-based FRONTIERA CORP. in a stock-for-debt deal ... Southeastern, Mich.-based COGNITIV INC. signed up Paine, Texas-based ELECTRONIC DATA SYSTEMS CORP. to provide technical support to users of its business-to-business exchange.

# Corporate Privacy Credibility Crumbles

**N**ews of questionable practices and security gaffes puts firms on the defensive

BY PATRICK THIBODEAU  
IN BOSTON

**C**HARISTOPHER Fisher, information systems director at Royal Appliance Manufacturing Co., agrees with a recent Harris Interactive Inc. poll that found that a majority of the public is mistrustful of corporate privacy practices and wary about sharing information. And he's doing something to address this true problem.

This past weekend, Fisher's company, the Glenwillow, Ohio-based maker of Dirt Devil vacuum cleaners, planned to launch a redesigned Web site that changes its data collection practices. Instead of asking for more customer information, Royal Appliance will ask for less. For instance, it will seek a customer's ZIP code instead of an address to help locate a local product supplier.

"The main thing we want to do is keep the site accessible and useful to the broadest array [of customers] possible but still provide value to people," said Fisher. By taking a minimalist approach to data collection, he hopes consumers will be more comfortable using the company's Web site and sharing personal information.

What Royal is doing may not be so unusual. Corporate privacy managers and experts have said that companies must do more to bridge a consumer privacy credibility gap that is showing signs of widening.

The most recent piece of evidence of customer mistrust was offered in a poll conducted by Rochester, N.Y.-based Harris Interactive for Privacy & American Business, a nonprofit think tank in Hackensack, N.J.; Ernst & Young International in New York; and the

American Institute of Certified Public Accountants in New York. The poll of 1,529 adults found that 75% believed that their information would be shared without their permission, and 69% felt that hackers could steal their data.

"I believe the trust gap that [the pollster] found is real," said Mel Petersen, chief privacy officer at Cincinnati-based Procter & Gamble Co.

Long before the Harris poll, Procter & Gamble took steps to reinforce consumer confidence by implementing a plain-language privacy policy, privacy seal certification, com-

panywide privacy training and an internal audit program and by allowing consumer choice on the use of such data, said Petersen. He added that large corporations with good privacy practices can suffer collateral damage from the privacy mistakes of others, which is why he is working with other companies and privacy groups to raise industry standards.

"If there were to be some egregious [privacy] violations, things could very quickly go sour, even for us," he said.

Experts and corporate officials don't have to look too far for a list of causes of consumer mistrust, such as the rise in identity theft, unsolicited commercial e-mail or spam, and telemarketing.

Just last week, The New

### The Roots of Mistrust Go Deep

**I**T managers can do a perfect job of managing privacy but still be penalized by consumers for other companies' lapses. It's like the boomer camp: Even if just one soldier messes up, everyone may be told to do 50 pushups.

The privacy mistakes of a few companies can affect an entire industry. But some corporate managers are also seeing feedback stemming from unrelated trends, such as identity theft and rising values of privacy.

The overall environment is "less trusting today . . . than it was a year ago, and that's the cumulative effect of consumer experience," said Kristen Walenta, an investment partner of Ernst & Young. "If businesses are going to be successful, they need to figure out how to turn that tide . . . to enhance what consumers want."

An e-mail poll last summer by The Gallup Organization, a think tank in Princeton, N.J., found that 80% of 400 users said they are "very concerned" or "somewhat concerned" about misuse of credit card data on the Internet. An oft-cited study by Cambridge, Mass.-

### What's IT to Do?

*If more firms follow good privacy practices, consumer confidence may increase, say experts and managers. Here are some things they say IT can do:*

1. Print an easy-to-understand privacy policy.
2. Obtain privacy seal certification.
3. Get an independent audit.
4. Collect only the customer data you need.
5. Give consumers choices.

York Times Co.'s intranet was breached by a security consultant, exposing subscriber names, addresses, phone numbers and even Social Security numbers.

### Getting a Seal of Approval

One company, Expedia Inc., said that strong privacy practices give it an edge with the public. The Bellevue, Wash.-based online travel service has received two privacy certifications from seal organizations, Truste, a nonprofit group in San Jose, and BBBOnLine Inc., a subsidiary of the Council of Better Business Bureaus Inc. in Arlington, Va.

Expedia also displays an sealing seal from PricewaterhouseCoopers, which emulated privacy and security practices with Expedia's actual privacy policy. PricewaterhouseCoopers and Deloitte & Touche LLP, both based in New York, also conduct penetration testing for Expedia.

While these extra steps are costly and time-consuming, "we believe it provides a competitive advantage," said Tony Gonchar, Expedia's customer relationship management and privacy director.

But in the post-Enron environment, even using an independent auditor raises issues. John Fetherman, privacy manager at The Reynolds and Reynolds Co. in Dayton, Ohio, advised firms to avoid potential conflicts by not using their own financial auditors for internal privacy audits. ■

-Patrick Thibodeau

# RETURN ON YOUR INVESTMENT

Fact: When your network is up, your business is up. Around the clock, and around the world. So, you want your network to be as reliable as possible. You want to talk to AT&T. We have a history of keeping complex networks running. Through whatever Man, Murphy or Mother Nature dishes out.

How? With experts who can help you assess and plan for just about every phase of network protection, security

and business continuity. Plus a knowledge base built on our experience with massive networks and computing environments. Including our own. It all adds up to 99.999% availability for your voice and data networks. Reliability for your business. Peace of mind for you.

Want to keep your network and your business up? Hook up with AT&T.

# Microsoft Stepping Into CRM Market

*It's developing software aimed at midsize firms through its Great Plains Software unit*

BY CAROL SLIWA

**M**ICROSOFT'S expansion strategy extended to the business applications space last week, when the company announced plans to offer customer relationship management (CRM) software.

The software maker also recently confirmed its intention to explore new offerings in enterprise storage and security, even going to the extent of creating business divisions devoted to those areas.

Microsoft Corp.'s foray into CRM will be executed through its Great Plains Business Solutions group, which specializes in business management applications for small and midmarket companies. Microsoft completed its acquisition of Fargo, N.D.-based Great Plains Software Inc. in April of last year.

Microsoft's new CRM offering, which is due to ship in the fourth quarter, is aimed at companies with 25 to 1,000 employees, according to senior product manager Holly Holt. She said customers will have two ways to enter the product: through Outlook mail clients or through Internet Explorer browsers.

## Big Impact

"It could certainly have a huge impact and really open up the lower end of the market for smaller-size to medium-size businesses," said Mary Wardley, an analyst at IDC in Framingham, Mass. "Many of these firms have Microsoft infrastructures and use Outlook, she noted."

Jim Prevo, CIO at Green Mountain Coffee Roaster Inc. in Waterbury, Vt., an Exchange Server and Outlook user, said

he sees the product as a potential "logical add-on" for his company. "We'll have to integrate it with our ERP back end, but it is worth a look," he said.

Analysts said they don't expect Microsoft to take on the enterprise CRM offerings from vendors such as Siebel Systems Inc., SAP AG, Oracle Corp., PeopleSoft Inc., Onyx Software Corp. or Pivotal Corp. in the foreseeable future.

Microsoft's product has only basic functionality compared with the feature-rich sales, customer service and marketing automation capabilities of the software from the major players, said Joe Outlaw, an analyst at Stamford, Conn.-based Gartner Inc. Microsoft's prod-

uct, for instance, isn't designed to support multiple lines of business, he said.

But, Outlaw added, "I have no doubt that they will gradually add more and more functionality to the product to make it appeal to larger and larger companies."

## Rents in Logistics

Great Plains entered the CRM space in 1997 with a logistics-intensive field service product to manage the dispatch of technicians to repair jobs. Two years later, the company forged a relationship with San Mateo, Calif.-based Siebel Systems Inc. to get its name on Siebel's midmarket CRM product, calling it Great Plains Siebel From Office, Holt said.

Holt said Microsoft's CRM technology won't have the sales channel management or telemarketing campaign man-

## Key Microsoft Business Applications

### Great Plains Logistics

**APPLICATIONS:** Accounting and finance, field services, e-commerce, supply chain management, project accounting and human resources

**MICROSOFT PRICE RANGE:** \$5,000 to \$200,000

### Great Plains Business

**APPLICATIONS:** Accounting and finance, e-commerce, supply chain management, field services, e-commerce, human resources

**MICROSOFT PRICE RANGE:** \$5,000 to \$50,000 per user

### Great Plains Business

**APPLICATIONS:** Accounting and finance, field services, e-commerce, supply chain management, manufacturing, project accounting and human resources

**MICROSOFT PRICE RANGE:** \$5,000 to \$50,000 per employee and \$5 million to \$50 million in revenue

**LICENSING PRICE RANGE:** \$5,000 to \$75,000

agement capabilities that Siebel MidMarket Edition has. Microsoft's product will handle only e-mail campaign management, she added.

According to Eric Klinkin, an analyst at Cambridge, Mass.-based Giga Information Group Inc., "It's not clear that midmarket companies want — or can afford — all the functionality that Siebel MidMarket

gives them." She added that "the dirty secret of CRM is that most companies only use about 20% of the functionality."

"The CRM midmarket has been crying for a market leader," Klinkin said. "Siebel and the big ERP vendors are too complex. And none of the midmarket vendors are a good long-term visibility bet. None are profitable."

## Microsoft Delays Launch of Net Server Operating System

*Also announces plans for XP service pack*

BY CAROL SLIWA

Microsoft Corp. disclosed last week that the release of its new Windows .Net Server operating system is being delayed until the second half of the year — the same time frame in which the first service pack of updates and fixes is due to emerge for its Windows XP desktop operating system.

The company launched XP on Oct. 25, but corporate users often wait for a product's first service pack before they consider deployment. A service pack typically includes all of the security patches and critical updates released since the product's launch.

The most recent release target for Windows .Net Server had been the first half of the year. A Microsoft spokeswoman said the company's

If corporate users wait for the first service pack of the delayed Windows .Net Server, deployments could be pushed into 2003, at the earliest.

But Tom Bitman, an analyst at Stamford, Conn.-based Gartner Inc., said users don't have to wait for the service pack with Windows .Net Server because of the incremental nature of most of the changes. "I think the way to see this is, Windows 2000 was NT 5 and .Net Server is NT 5.1," he said.

The most recent release target for Windows .Net Server had been the first half of the year. A Microsoft spokeswoman said the company's

new Trustworthy Computing initiative — which, in part, calls for all software to be scrutinized more intensely from a security standpoint — may cause modifications and additions to engineering processes. She said that could lead to longer delivery schedules but higher quality in the long term. The spokeswoman added that testing and customer feedback also were factors in the delay.

Bitman said Microsoft is trying to solidify the design of the .Net architecture and kill any bugs. "It's not as easy as they were hoping, and I think they're trying to do it right," he said.

## Separation Anxiety

The new projected ship date for Windows .Net Server will lead to a separation of at least nine months from the release of the Windows XP desktop operating system. Both operating systems are based on the same source code.

"Clearly, they're going to still try to maintain a common code base, but the more that you separate, the more you have dual-development issues," Bitman said. "For example, if they find a bug in XP right now, they also have to fix that in the libraries being developed for Windows .Net Server."

In addition to the usual bug fixes and security patches, the first service pack for Windows XP will incorporate any operating system changes called for under the consent decree that Microsoft reached with the U.S. Department of Justice, a Microsoft spokeswoman said. She declined to provide further details.

"This is business as usual — the typical rollout for service packs following a product launch," she said. ♦

## BRIEFS

### Novell Names Vice Chairman; COO Leaves

Novell Inc. brought back former executive Christopher Stone to work as vice chairman within a new "office of the CEO." Stone will report to CEO Jack Mowman and will run engineering, marketing, consulting and other areas. Novell also announced the resignation of Stewart Helton, who had been chief operating officer. In addition, the company reported revenue of \$271 million for its first quarter ended Jan. 31.

### New York Times Co. Fixes Intranet Holes

The New York Times Co. patched security holes in its corporate intranet after a hacker gained access to some of the company's databases, including ones that contained Social Security numbers and other information about many employees. A spokesman said it's continuing to investigate to ensure that the network is protected against further intrusions.

### Security Flaws Found in PHP Language

Security researchers warned of multiple vulnerabilities in the open-source PHP scripting language. The holes could let Web servers running early versions of PHP for Apache and IIS and Samba at risk of being hit by buffer overflows attacks. The problem can be fixed by installing a patch available at [www.php.net](http://www.php.net) or by upgrading to Version 4.3.2 of the HTML-unfriendly scripting tool.

### ICANN's Lynn Calls for Organization Overhaul

Stuart Lynn, president of the Internet Corporation for Assigned Names and Numbers (ICANN), proposed a series of structural changes at the March 6 meeting of ICANN's board of directors, including a reduction in the size of the ICANN board and the end of at-large board elections.

# BEA Moves to Better Unify Its Middleware

**Users say they like the idea of integrating products but don't want to be locked in**

BY MICHAEL MEHAN

SAN DIEGO

**I** OOKING to improve the ability of its middleware to serve as enterprise-grade glue for users with a mix of different applications, BEA Systems Inc. last week announced plans to combine its tools into a unified and better integrated bundle.

At its annual user conference here, San Jose-based BEA said it's linking its application server, portal and integration software into a single package along with a new Java development tool that was unveiled last week (see related story below). The company is building shared source code into the products so they will be easier to install and work more in concert, BEA executives said.

IT managers at BEA's eWorld 2002 conference said they were exactly that kind of unified application infrastructure. But

they also acknowledged that if BEA and its chief middleware rival, IBM, succeed in delivering the technology, users who buy into it will become highly dependent on the vendor they chose.

"So far, [BEA's software] user fees haven't been a problem for us, but it's always a concern," said Denise Fishel, director of e-business planning and development at Toshiba America Business Solutions Inc. in Irvine, Calif.

BEA's WebLogic Server software is playing a key role in a \$2 million project to unify the different online portals that Toshiba America developed for dealers of its copiers, fax machines and printers. The company is also switching from a homegrown e-commerce system to Oracle Corp.'s iStore software. "Without BEA in the middle, we wouldn't be able to undertake this kind of migration," Fishel said.

### Java Tool Tied to WebLogic, for Now

BEA Systems claimed that the WebLogic Workshop development framework it unveiled last week will make big strides in easing the creation of Java-based Web services applications for programmers of all skill levels.

But while corporate developers may want better general-purpose Java tools, it remains to be seen how much the BEA tool will help address their needs. That's because in its current form, WebLogic Workshop is only for building Web services and will not on BEA's application server platform.

"I would have to see BEA's offering, but I would very concerned about proprietary annotations that would mean I couldn't move an

application between multiple platforms," said Bob Dutil, a senior vice president in Cleveland-based KeyCorp's application architecture group, which was BEA's first WebSphere application server package.

"One of the reasons we are a Java shop is because Microsoft was too proprietary," Dutil added.

Mark Driver, an analyst at Stamford, Conn.-based Gartner Inc., said other vendors' tools don't understand the "proprietary" annotations that BEA built into the Workshop source code. The annotations provide instructions on how to wrap a Java program as a Web service and deploy it on the application server. BEA senior product manager Byron Sebastian acknowledged

### More on His Plane

At its user conference last week, BEA also:

- Announced a WebLogic Server extension that adds support for IBM's iSeries and other mainframes.

- Said it had acquired AppGate Software Inc. of Sunnyvale, Calif., a developer of secure channels of Java and mobile devices (J2ME) software.

- Reached an agreement with Intel to optimize AppGate's J2ME code for Intel's next servers based on Intel's Pentium and Itanium chips.

- Launched a new Internet portal and other tools to support developers who use its WebLogic Server and its other products.

The integrated WebLogic Platform 7.0 bundle is due to ship by midyear, but BEA didn't disclose pricing details last week. The package is based on WebLogic Server 7.0, a new release of the company's flagship application server.

United Air Lines Inc.'s key loyalty services division, which manages frequent-flier programs for the Chicago-based airline,

that "some amount of work" would have to be done to get the Workshop tool, code-named Cauis, to run on another application server. "But it's certainly possible," he said.

Sebastian added that BEA plans to standardize the annotations used in the new development framework through Sun Microsystems' Java Community Process.

But some analysts said there's no guarantee that other vendors will use the resulting reference implementation to create tools that can run on non-BEA platforms.

Nick Gall, an analyst at Metia Group in Stamford, Conn., said he fears different vendors will eventually offer Java development tools based on a common core. He doesn't think, but he predicted, that "will take another 12 months to solidify."

Engineered by former Microsoft

is another WebLogic user. Rob Robless, chief technical officer for the division, said he hopes to use Enterprise JavaBeans within the BEA software to componentize applications so they can be ported to multiple operating systems.

"The whole idea of this is not to be controlled by the technology," Robless said. But he added that users can find themselves stuck with vendors no matter what technology choices they make.

Alfred Chung, BEA's president and CEO, said competition and the complexity of enterprise-level IT infrastructures should prevent any single vendor from grabbing too much power.

Rick Barry, a BEA user who is vice president of information systems at Dallas-based broadband services provider IP Communications Inc., suggested customers who want to avoid technology lock-in should refrain from using proprietary extensions that vendors build into application servers and other Java-based software.

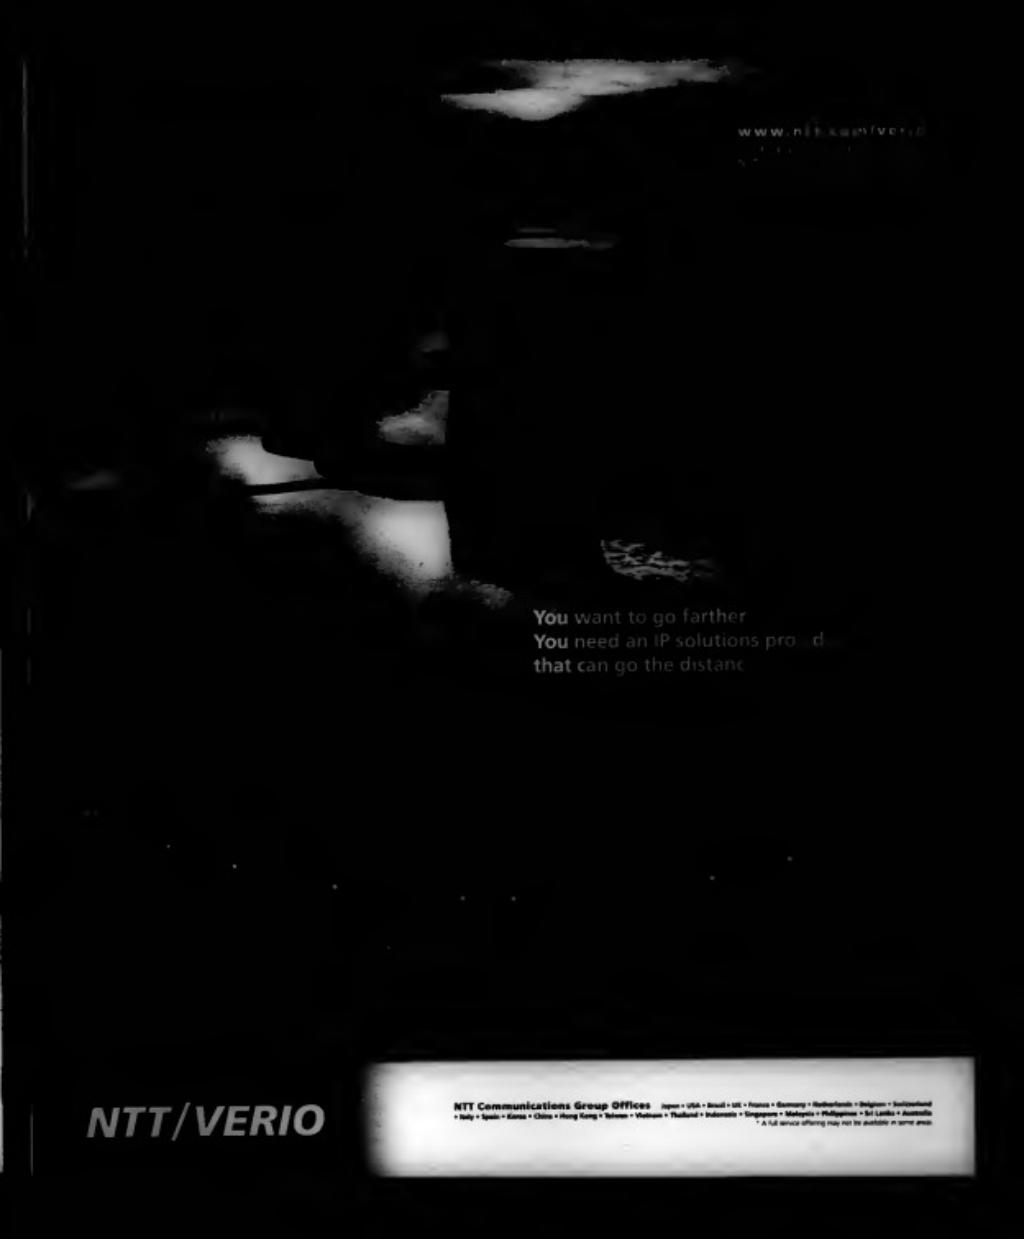

Robless said users should also pay attention to how quickly vendors such as BEA take their proprietary product add-ons and open them up to other vendors through Sun Microsystems Inc.'s Java Community Process. ▀

Cup employees, BEA's new framework aims to remove the need for developers to understand the complexities of the underlying Java environment, similar to the way Microsoft's Visual Basic ease programming for Windows.

A beta version of WebLogic Workshop is available now, and the tool is due to ship later this year. Sebastian said the tool is for building Web services applications only, although analysts predicted that it will become more general-purpose.

"This is the first step of many that will need to be taken by BEA and other vendors of the EEE development to look hard and painful in regards to the software quality achievement," said John Meyer, an analyst at Cambridge, Mass.-based Oiga Information Group Inc.

# DHL Builds U.S. Data Center To Help Manage Global Net

**Arizona facility will cost \$250M over five years, link to sites in U.K. and Malaysia**

BY LINDA ROSENBERG

**D**HL WORLDWIDE Express Inc. plans to spend \$250 million over the next five years to build and operate a U.S.-based data center that will complete a trio of facilities designed to provide round-the-clock man-

agement of the air freight carrier's IT systems and networks.

The new data center will be located in Scottsdale, Ariz., and is due to be fully operational by September, San Francisco-based DHL said last month. The Scottsdale facility will be linked to the company's existing data and IT services

centers in London and Kuala Lumpur, Malaysia.

Each center is located within one of the three geographic regions DHL uses to divide its global business operations into separate units. But the IT facilities will work in tandem to manage the company's entire network infrastructure 24 hours a day, seven days a week, DHL said.

Each data center will be in charge of the company's DHL-NET computing and telecom-

munications network for eight hours and will then pass control to the next facility. DHL said the centers will manage IT operations in nine-hour shifts, covering the eight hours of network support plus a one-hour overlap period for the transfer of control.

The Scottsdale facility will occupy 106,000 square feet of space, according to DHL. A company spokeswoman would not comment on the system and applications that will be

installed in Scottsdale, other than to note that the technology used at DHL's regional data centers includes network monitoring tools and fault-reporting systems.

Those systems are designed to ensure that IT problems are detected quickly, the spokeswoman said. In the event of network failures, backup systems and network circuits will kick in automatically, she added.

DHL currently has a smaller IT operation in Burlingame, Calif. The company said it plans to employ about 350 workers at the Scottsdale facility, making new hires with workers who will be transferred from Burlingame and other sites in Canada and Latin America. ▀

## Mainframe Skills

using part of his annual training budget to bring younger workers up to speed on mainframe technologies.

And the skills crunch is only going to get worse, according to Stamford, Conn.-based Meta Group Inc. As part of preliminary results from a survey of 300 midsize and large companies, Meta has found that it will take 55% of IT workers with mainframe experience are over 30 years old.

A bigger problem is that more than 50% of the companies that have mainframe staffs

said in the survey that they have "severe bottlenecks" for dealing with the diminishing pool of skilled workers, said Meta analyst Maria Schafer. Meanwhile, all indications are that legacy mainframe systems and applications — not to mention new technologies such as IBM's zSeries servers — will be around long after those workers have retired.

Companies continue to add a total of about 5 billion lines of Cobol code annually to their data center systems, according to Bill Ulrich, president of management consulting firm Tactical Strategy Group Inc. in Soquel, Calif. And in January said its annual mainframe revenue grew last year for the first time since 1999.

Industries that are expected to hit particularly hard by the mainframe skills shortage include telecommunications, banking and finance, insurance and government, all of which have large installed bases of mainframe systems.

"The mainframe is the foundation that everything is built on there," said Don Grib, first vice president and manager of information processing engineering services at Melton Financial Corp. in Pittsburgh. "The majority of our data is still residing on a mainframe, even though a lot of it is front-ended through the Web and

e-commerce applications."

Among other steps it is taking aimed at preserving its mainframe know-how, Mellon has launched a summer internship program during which the company teaches mainframe skills to university students it hopes to recruit after they graduate, Grib said.

But David Lewis, CEO for the Massachusetts state government, said he's more con-

cerned about the skills that can't be taught and have to be learned by workers through hands-on experience.

"Where you start running into really tricky issues is around the products that run on the mainframe, and how they interrelate to each other," Lewis said, calling that "an acquired skill" that will take time for new workers to grasp.

"You don't go to school to

see how CA interacts with IBM," Lewis said, referring to software vendor Computer Associates International Inc. in Islandia, N.Y. "You learn it by experience. That's where I frankly think the greatest risks exist [for companies]."

For more stories and resources related to mainframes, visit us at [www.computerworld.com/mainframes](http://www.computerworld.com/mainframes).

**Attention: Calling All Cobol Veterans**

Rochelle, Md.-based vendor whose products include Cobol analysis compiler.

Peyson, who is working from a database that correlates the names of mainframe programmers, many of whom previously were tapped to work on Y2K projects, said he has identified 3,000 to 4,000 Cobol veterans who want to return to work on a contract basis.

"They don't want full-time jobs, but they're sick of sitting on the beach or playing golf all the time," he said.

Although all the details haven't yet been worked out, the idea is that companies will go through PAGE to contact workers who are listed in Peyson's database. PAGE would function as the employer of record for the workers.

The Legacy Reserves also plan

to offer workers training in Java and .NET and mobile mainframe applications, Peyson added.

Bob Schwartz, CEO at Matsushita Electric Corporation of America's Panasonic CS division in Secaucus, N.J., said Peyson's database of experienced workers "may become intriguing to use when we need those skills."

But other IT managers said they would prefer to hire full-time employees, not contractors.

"With contractors, there tends to be a lack of an organizational off-site," said Leon Gullman, former CEO at Harvard Pilgrim Health Care Inc. in Wellesley, Mass.

"With full-time [employees], you can really focus on staff development and incorporating them into an organizational mission," added Gullman, who's now a principal at Easter Group Inc., an IT consultancy in Cambridge, Mass.

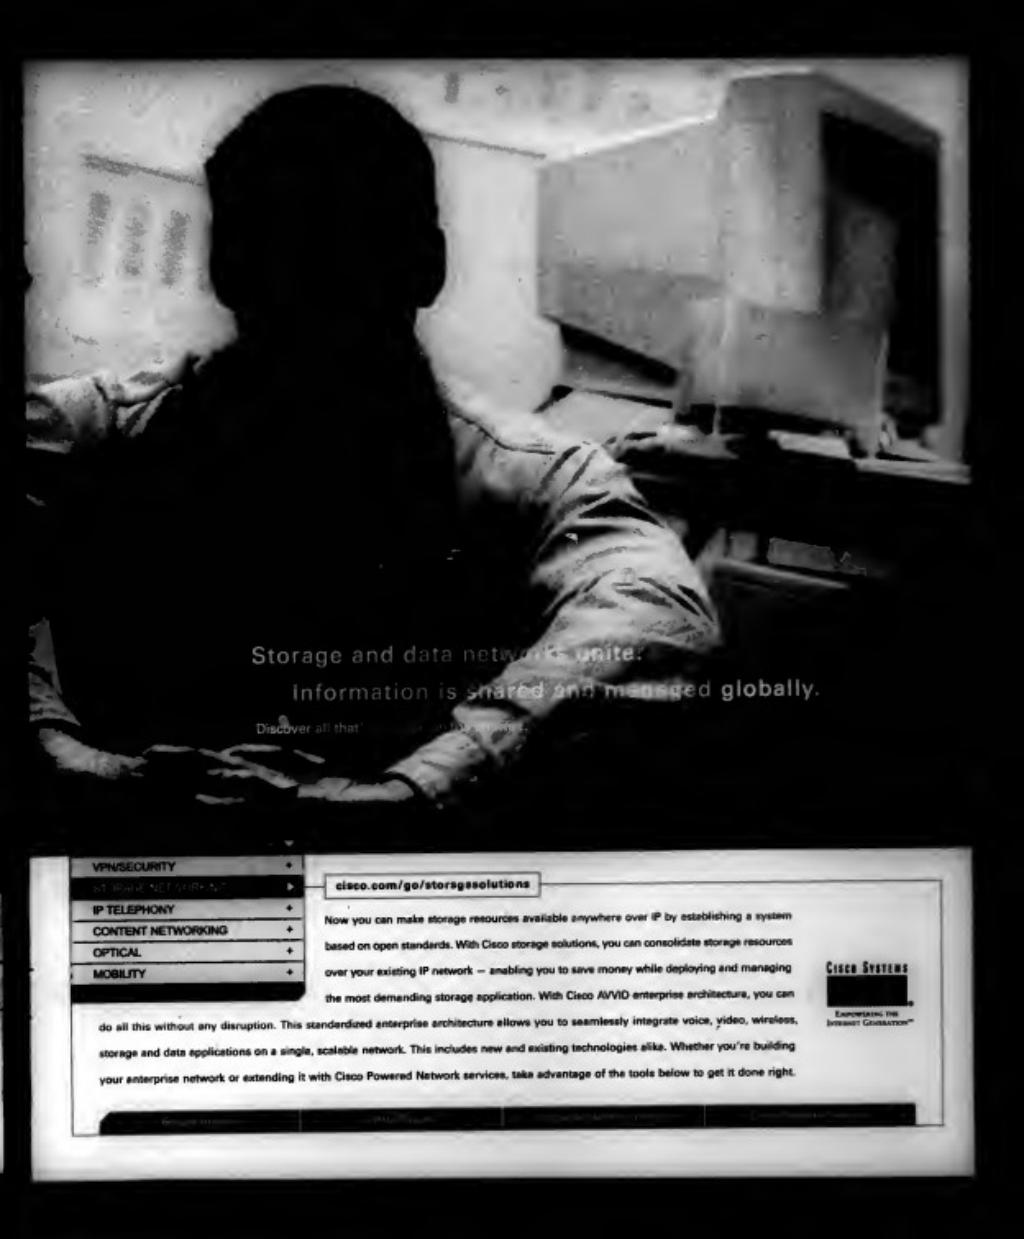

— Julie King

## Mainframes Ride Again

■ IBM's mainframe revenue rose last year for the first time since 1995. In addition, shipments of mainframe MIPS increased 12% year-to-year in the fourth quarter and by more than 40% in each of the other three quarters.

■ More than 200 million lines of Cobol code are still in use today, and 6 billion lines are added to production systems each year. It costs \$30 per line to replace Cobol-based programs.

## American Express Signs \$4B IT Services Deal With IBM

**Pay-as-you-go contract includes transfer of 2,000 IT workers to IBM**

BY TODD R. WEISS

In a blockbuster deal that's expected to be worth more than \$4 billion over the next seven years, American Express Co. is outsourcing a big piece of its IT operations — and transferring about one-third of its 6,000 technology workers — to IBM.

New York-based Amex last week said it expects to save "hundreds of millions of dollars in IT costs" during the life of the outsourcing contract with IBM's Global Services unit.

The deal took effect on Fri-

day in the U.S. and will be extended to the financial services firm's international operations starting in May.

Under the agreement, Amex will maintain oversight of its IT strategy, key vendor relationships, its voice and data network and development of applications and databases. But the company will give IBM the reins of its IT operations infrastructure, including major data centers in Phoenix and Minneapolis.

Amex CIO Glen Salow said the company, which processes

about 1 billion transactions daily, will receive IT support services from IBM on an as-needed "utility model" basis.

As part of the deal, IBM has promised to proactively reallocate IT resources and add new computing capabilities as business needs change at Amex.

In addition, part of the fees Amex pays to IBM will depend on the amount of IT services work it actually requires. Salow described that part of the arrangement as "out-tasking." The deal "achieves a level of flexibility while assuring ourselves ... a good price and quality [of service]," he said.

Bruce Caldwell, an analyst at San Jose-based Dataquest Inc., said the agreement mixes traditional outsourcing with the

new pay-as-you-go approach to IT services being offered by IBM and rivals such as Electronic Data Systems Corp.

### High-Profile Customers

IBM's success in signing up a high-profile customer such as Amex gives the utility concept — as well as IBM — a big credibility boost, Caldwell said. "It's a major endorsement by a major American company with huge IT resources," he said.

The IT contract between Amex and IBM follows a \$75 million agreement for as-needed IT services that Plano, Texas-based EDS signed last month with Dallas-based convenience store chain 7-Eleven Inc. EDS also signed a similar

services contract in August with Golden, Colo.-based Coors Brewing Co.

The 2,000 Amex employees who will be offered positions at IBM include IT operations workers, technical support staffers and programmers, the companies said. About 1,000 of them work at the Phoenix data center.

The transfer of the U.S. IT operations is due to be completed this month, while international operations will be shifted in a phased approach that's expected to take several months.

IBM will manage data center services from the Amex IT facilities in Phoenix and Minneapolis. Technical support services will also be provided on-site to Amex's business operations worldwide, the companies said. ■

**When choosing a technology partner,  
there are many things to look for.**

**Always start with this.**

**Microsoft**  
**CERTIFIED**  
**Partner**

The above logo represents the pinnacle of business technology in the world today. The companies that bear it are Microsoft Certified Partners, and when you encounter one, you encounter a professional proven to be the best at what they do. They have the most certified experts on staff, receiving their training, support and tools directly from Microsoft. They have the broadest range of experience, having expertise in areas such as networking, infrastructure, collaboration, and many other leading disciplines. And there's a Microsoft Certified Partner right near you.

# Ariba Ships 'Spend Management' Tools

**Shift from B2B aims applications at managing, analyzing corporate spending**

BY MICHAEL MECHAN

**A**riba Inc. last week announced new invoicing, spending analysis and contract monitoring tools, continuing its attempt to redefine itself as a vendor of "spend management" software instead of business-to-business products.

Sunnyvale, Calif.-based Ariba formally introduced its Spend Management Suite, which adds purchasing analysis capabilities to its product sourcing and procurement tools. Ariba is also expanding its sourcing and procurement lines with several new or upgraded applications.

All of the products became available last week except for the analysis software, which is in beta-testing now and is set for general release by the end of this month, Ariba said.

The new suite continues a migration away from transaction-centric business-to-business software that Ariba began early last year and accelerated in the fall after Robert Calderoni was named CEO.

Analysts said the strategy change was critical for Ariba's

continued survival after the business-to-business market crash last year. But they cautioned that the company's transformation is far from complete.

Ariba's technology roots are in "white collar procurement" applications that automate the purchasing of office supplies and other goods outside manufacturing, said Karen Peterson, an analyst at Gartner Inc. in Stamford, Conn. "They still

need to prove that they can expand into more complex areas of the enterprise," she said.

Ariba faces plenty of competition for managing supply chain purchasing activities, Peterson said. She described i2 Technologies Inc. in Dallas as the vendor with the most in-depth technology for managing supplier relationships.

Frictionless Commerce Inc. in Cambridge, Mass., also has an integrated purchasing suite, and it teamed up with Rockville, Md.-based supply chain vendor Manugistics Group Inc. last summer to offer a uni-

fied set of supplier relationship management tools.

Commerce One Inc. in Pleasanton, Calif., plans to add new invoicing and contract management applications by midyear, and Peterson said enterprise resource planning (ERP) giants such as SAP AG and Oracle Corp. are also developing full suites of sourcing, procurement and spending analysis tools.

Joseph Marino, an analyst at Comptech Analysis Inc. in Sterling, Va., said the first release of Ariba's spending analysis tool "is not fully developed at this point" and will likely require a lot of fine-tuning.

But Marino said Ariba and other business-to-business vendors can still beat ERP and supply chain vendors on procurement functionality. ■

## Intel Sticks With R&D and Production Spending Plans

**CEO says new technology needed to boost chip sales**

BY JENNIFER DIBBINGHO  
SAN FRANCISCO

Intel Corp. suffered along with other technology vendors during 2001, which CEO Craig Barrett described in January as "a terrible year." But the chip maker isn't backing off from its plans to invest heavily in product development and new manufacturing facilities.

Despite a big drop in chip sales, Intel is moving forward with development and capital spending programs expected to cost about \$20.7 billion in combined expenses from this year and last. Barrett said at last week's Intel Developer Forum here that the firm is dipping into its cash reserves to help fund the spending.

But Barrett said the investments are needed to help maintain Intel's "ecosystem" — the vendors that depend on improved processing power to

develop new products and the users who need those products to meet business demands.

"We have to innovate our way out of this recession with new technology, new products," he said. "If there was ever a time where we needed to move faster down the technology curve, this is it."

Intel made a slew of product announcements at the semiannual conference, touting faster processing speeds as a key feature. Topping the list was a new Pentium 4-based Xeon processor for use in two-way servers (see box). The company also announced that a second-generation version of its 64-bit Itanium processor, code-named McKinley, will be released this summer.

### New Manufacturing Process

In addition, Barrett said Intel has started shipping microprocessors built at a new plant in Oregon that uses 300mm wafers and its 0.13-micron manufacturing process. Five plants worldwide use the 0.13-micron technology, he said.

## Chips In The Bag

*Intel announced these products last week:*

**A Pentium 4-based Xeon processor** that boosts the speed of dual CPU servers by up to 80%.

**A companion E7500 chip set** that doubles the memory bandwidth of Xeon-based servers.

**Three single-chip Gigabit Ethernet controllers** by Intel for use in PCs and servers.

**A line of network and storage networking components based on Intel's XScale technology**.

To help fuel a return to growth, Barrett said, IT vendors need to address issues related to online security and the use of technologies such as wireless communications and Web services.

Intel itself could aid in improving IT security by providing increased processing power to accommodate demanding encryption protocols, said Graham Titterington, an analyst at UBS in London.

But Titterington and other analysts said new developments, such as stand-alone encryption chips, probably won't be available in products for at least a couple of years. ■

## BRIEFS

### Judge Denies Xerox Injunction Request

A federal judge in Rochester, N.Y., denied Xerox Corp.'s request for an injunction that would have barred Polar Inc. from selling its handheld devices, Santa Clara, Calif.-based Polar is appealing the judge's December ruling that it and former parent company 3Com Corp. infringed on a handwriting-recognition patent held by Stamford, Conn.-based Xerox.

### Sapient Makes 22% Workforce Cut . . .

Sapient Corp. laid off about 545 employees in the third round of cutbacks during the past 12 months. The new layoffs reduced Cambridge, Mass.-based Sapient's workforce by 22%. The company also warned that its first-quarter loss could be slightly larger than expected and said its chief financial officer is leaving to take another job.

### . . . While Scient Has Big Revenue Drop

New York-based IT consulting firm Scient Inc. reported fourth-quarter revenue of \$200 million for the fourth quarter, down 20% from \$262 million in the same period of 2000. Scient said it lost \$55 million in the quarter compared with a year-earlier loss of \$274 million. The results are preliminary for the former Scient Corp. and GCI Enterprises Inc., which merged in November.

### Short Takes

Tulsa, Okla.-based broadband network operator WILLIAMS COMMUNICATIONS GROUP INC. said it may file for bankruptcy protection as part of a debt reduction plan. . . . COMPGROUP COMPUTER CORP. has agreed to sell a software division called Image Processing to a unit in Ay, Scotland, to St. Petersburg, Fla.-based JASIL CIRCUIT INC.

# The Question for 2002

**W**HAT HAVE YOU done for me lately?" may well be the question for 2002. Be it companies asking workers or workers asking companies, that cry hangs endlessly in the air as revenue-stressed businesses forget to care and workers struggle to remain motivated. For most of us, this means more pressure to increase our workloads.

IT management is under intense pressure to think up new ways to cut costs, increase revenue or improve productivity. There's no time for resting on past laurels when even greater heroes are demanded. In our Business section this week (page 28), we look at three IT leaders who met that challenge. Each delivered solutions that not only addressed current problems but will also provide payoffs down the road.

One is Fran Dramis at BellSouth, who designed a technology transformation road map to help business units define the systems they need to enhance and grow revenue — not just for today, but for years to come.

To view IT heroes on a national scale, check out our Page One update on what happened to the flood of offers of technical assistance in the wake of the Sept. 11 attacks. Our stories look at just a few of the many inspiring actions taken by IT professionals willing to look beyond their personal pain to find ways to contribute. For many, the question became, "What can I do for my community now?" not, "What has my community done for me lately?"

Indeed, hundreds of thousands of IT volunteers signed up, and many were tapped. Because of them, an unbelievable amount of progress was made. But, as our report uncovers, we also need an organizational road map to make sure we're better pre-

Patricia Keeffe, editorial director of Computerworld. You can contact her at [patricia\\_keeffe@computerworld.com](mailto:patricia_keeffe@computerworld.com).

"national emergency technology guard." It would provide a single point of contact and clear chain of command to coordinate the science and technology sectors to prevent and respond to disasters. Services delivered by this agency would include a database of IT professionals willing to help out, complete with equipment and donations they can offer; a reserve of equipment needed in an emergency; clear guidelines for businesses affected; an emergency hot line and Web site; and a large-scale risk management strategy to protect critical infrastructure.

The problem? A cacophony of well-meaning efforts all targeting the same goal — matching up IT professionals and equipment with companies needing assistance — but with different approaches and levels of expertise. Many offers of assistance went unheeded as a result, and yet the need is more important than ever. (See our list of links for places to donate, page 6.)

Here are some suggestions of what you can do in the meantime:

- Back the efforts of Sen. Ron Wyden (D-Ore.), chairman of the Senate Subcommittee on Science, Technology and Space, to create a

"national emergency technology guard." It would provide a single point of contact and clear chain of command to coordinate the science and technology sectors to prevent and respond to disasters. Services delivered by this agency would include a database of IT professionals willing to help out, complete with equipment and donations they can offer; a reserve of equipment needed in an emergency; clear guidelines for businesses affected; an emergency hot line and Web site; and a large-scale risk management strategy to protect critical infrastructure.

- Contact the New York Software Industry Association, which will devote its annual summit, being held March 8, to help further centralize business relief efforts.

- Register with groups such as Restart Central, an aid program created by several New York City groups that has so far matched more than 850 donations and volunteers and is still working with about 260 businesses, most of which are looking for permanent office space and basic office equipment.

It's time we all looked into the mirror again and asked, "What have I done lately for my company, my co-workers, my country?" ■

PIMM FOX

## Portals Can Open Array Of Services

**M**EASURING THE value of enterprise portals is more art than science.

But don't let that sway you from embracing them to consolidate disparate back-end application services through self-service front ends to save money and boost revenue. Tread carefully, though, because there are obstacles.

"The problem with portals is not technology, but rather organizational obstacles defining goals, adopting a clear business plan and even how you describe different portal features," says Note L. Root, an analyst at Forrester Research.

Vendors contribute to this mess. Their out-of-the-box adapters to back-end legacy applications and outside Web services seem an easy win. But since-source adapters will never be enough to get your portal humming.

To start the portal process and get buy-in from the chief financial officer, look at your ERP implementations for opportunities to streamline access to services. For example, a portal could replace an in-house travel reservation system, dropping money to the bottom line. Define specific functions inside packaged applications from vendors such as SAP, PeopleSoft and Siebel Systems that could help users do their jobs. Delivery of employee-benefit updates or adjustments to production schedules are self-service activities ideal for portal delivery.

This means understanding features that transform a portal into more than just a source for sports scores and company holiday information. Recognize that adding portal users could put a strain on ERP applications, and think

**Quick  
Link**

For Computerworld subscribers and links to resources of interest to them, go to [www.computerworld.com/quicklink](http://www.computerworld.com/quicklink)

about near-real-time caches to prevent outages.

Portal design should incorporate functions to save money, rather than show off technology. Just because a call center action touches three different back-end systems isn't justification for making it a portal feature. "It might cost more to get rid of those manual touch points while adding unwarranted complexity to the portal," says Root.

And don't confuse portals with application integration from companies such as SeeBeyond Technology, TIBCO Software and Vitria Technology. Portals are about service, not application integration.

Purchase application servers first, rather than portal or integration servers, because application servers drive portal transactions. And with portals costing more than \$1 million in development, according to Forrester, you should base portal and integration server decisions around the use of common code.

Plumtree Software, the market leader in portal products, offers a discrete portal server, but you can also take advantage of your application server infrastructure to develop portal technology. For instance, IBM and BEA Systems let you use application server tools to develop portal technology.

Portals hold a lot of promise, but they require special attention before they'll pay dividends. ♦

## DAVID FOOTE Good Ethics At Work Lie In the Hiring

**T**HE ENRON mess sure seems to be opening up a lot of old wounds.

For instance, several years ago, I was employed by a popular consumer electronics company, until it lost half its stock value overnight when it was accused of playing fast and loose with its financials. Thankfully, being fresh out of school, I had only my mind to lose instead of a fat retirement account.

One must be careful talking about crooked executives, though. Chicanery at the highest levels of corporate America has been tolerated — even romanticized in books and films — since the Rockefellers, Mellons and Kennedys made their fortunes. It's part of

our culture. And it's not like we haven't heard populist politicians before preaching reform when hard-working employees are suddenly feeling abused.

Public concern about ethics is cyclical, like hemlines and teenagers' musical tastes. In vogue now are corporate accounting practices, privacy concerns and executive greed. When several on-the-brink dot-coms wanted to sell their online customer lists, consumer advocates protested. When employers began to monitor workers' e-mails and Web surfing behaviors, employees and privacy advocates strewed. And there are always suspicions about relationships between vendors and IT executives, and between recruiters and IT workers.

We in IT have a choice: subscribe to some code of ethics, or don't. But no policy, program, employer or government can force us to make this choice. On the other hand, no one forced people to work for Enron or to play Russ-

Jim Barron is a president and CEO of private Parsons TLL, a management consulting and IT workforce research firm in New Canaan, Conn. Contact him at [jim.barron@parsonstll.com](mailto:jim.barron@parsonstll.com).

ian roulette with their retirement accounts.

Don't expect clarity on what passes for ethics. Deciding where to draw the line on business behavior reminds me of the inability of Supreme Court Justice Potter Stewart in 1964 to adequately explain what constituted pornography and obscenity; instead, he declared, "I know it when I see it." The same holds true for us. Ultimately, we'll know the companies that best match our personal codes of ethics and should select them as our ideal employers.

The hasn't stopped companies from attempting to police ethical matters, including by using these strategies:

**Making employees sign a code of ethics.** Lists of ethical standards and practices are simply corporate liability boilerplates that undermine trust and are largely ignored by workers.

**Hiring an ethics consultant.** College professors moonlight as consultants to arbitrate employer-employee show-

downs on ethical matters and to help employers refine policies and practices on corporate values and ethics.

Though helpful, they typically arrive too late to change anything truly consequential and have trouble navigating ethics in the real world of businesses operating under extreme pressure to ground out profits.

**Appointing a chief ethics officer.** Along with an independent ethics review group advising the board of directors, "the other CEO" is tasked with keeping alive the notion that ethical concerns do matter. This sounds good, but reality dictates that this is viable only for companies in which the chief executive's power and influence have been sufficiently checked and balanced.

The only true way to enforce ethical behavior norms is to select and hire the right people. With a focus on personal and professional ethics upfront, enforcement is much easier, and outcomes are more predictable. But this must start at the CxO level so that appropriate behaviors can be modeled by the workforce in the same fashion we model our parents' ethical imprinting. ♦

## READERS' LETTERS

### Make Spammers Pay

**I**N "SPAM: Taking a Toll on Business Systems" [News, Feb. 15], Todd Meagher of Credit.com said the potential loss of legitimate business correspondence inherent in blocking spam is an acceptable price to pay. It's outrageous that people feel that helpless. Spam costs businesses lots of money. That cost should be borne by the spammers, and tough legislation needs to be enacted to let companies sue those who deluge their in-boxes with spam. In addition, those who send sexually explicit spam to addresses accessible by children need to be prosecuted.

There are a few things people can do to fight spam. First, use an ISP that provides spam filtering. Second, report spam to SpamCop.net, which will parse the headers and determine the real source. You can then notify all the systems administrators involved that their

systems have been used by a spammer. But the most effective thing is to hit spammers where it really hurts: in the pocket. To do that, don't buy anything from a spammer, and ask your congressman to enact legislation to make spammers pay.

PAUL A. STRASSMANN

## Out of Alignment

I HAVE ALWAYS BEEN AMUSED by simplistic methods offered to CIOs to answer complex questions about the health of IT. One recent attempt is particularly noteworthy because it received widespread publicity and reputable endorsements.

Last fall, a journal for CIOs published a five-page feature, advertised as a diagnostic tool, with the ambitious title "How to Improve IT/Business Alignment." Introductory explanations claimed that this tech-

nique was successfully tested with more than 25 Fortune 500 companies and used in studies sponsored by the Society for Information Management and The Conference Board.

It required the placement of check marks on a grid consisting of five columns and 36 lines representing 38 questions. A check mark in the first column was worth one point, a mark in the second column two points, and so forth, with five points for each mark in the fifth column. A respondent could score anywhere from 38 to 190 points, with a relatively high score signaling a high level of IT alignment with the rest of the business. The proponents' assumption was that the higher the score, the stronger the alignment, and therefore the more benefits a business would see, which would ultimately be reflected in its financial performance. For instance, if a CIO reported to the CFO, that would be worth one point. If the CIO reported to the CEO, that would be five points. "Rarely measuring the value of IT investments" was worth one point, but using a balanced scorecard approach awarded you five points. Other characteristics that were scored included service-level agreements, how projects are prioritized and architectural integration.

The publicity given to this methodology and its claims heightened my curiosity about its value. As a scorekeeper of corporate profitability and IT spending, I offered to test the tool's validity. The researchers graciously provided me with each corporation's individual score (subject to an agreement to not reveal the identities of the firms or researchers).

My findings? After I compared the alignment scores with the actual financial results delivered by the firms that were used to test the methodology, I found absolutely no relationship between the overall score and other independent measures of financial results. There were high-scoring firms that were losing money, and there were low-scoring firms that delivered exceptional

profits. So the methodology failed in perhaps its most important test of relevance to a board of directors.

I view that as an example of contemporary astrological practice as applied to assessing IT excellence. Astrology, in which I take an active interest, takes factual observations about stars, planets and the calendar and converts them — by unverifiable methods — into prophecies about events on Earth. I would classify any method for cobbling together descriptions about IT-related practices into predictions about IT excellence as being like astrology rather than an application of reproducible analysis that can help IT.

### Executive Implications

I have seen many examples of methodologies that follow similar patterns. Some are relatively modest and perhaps involve filling out a grid. Others are ambitious, often asking that more than 150 line items be scored via elaborate schema. This includes most of the measurements of an organization's "maturity level." The widely adopted balanced scorecards disguise their astrological origins by arbitrary choices of ratings criteria. For instance, one requirement to qualify a firm's ranking of its computing innovation attributed 20% of that score to whether it installed the latest version of Windows on all desktops!

All of these methods measure criteria that are mostly unrelated to top executive concerns, which are primarily economic. In other words, CEOs couldn't care less about conformance with what academic claims are desirable behaviors. What they do care about is increasing profitability and whether IT is helping to do that.

As IT management and budgets come under increasing scrutiny today, don't bank on scoring well using astrologylke methods. Proving that dollars saved and earned will add to the bottom line will count for more.

**PAUL A. STRASSMANN**  
Strassmann believes that astrology-like methods are possible ways to measure the health of IT because they're cheap, don't require a lot of time and avoid accountability.

BOB COATES (fourth from the right), CIO at Edwards Theatres Circuit, helped automate cash flow for one of the largest theater chains in the U.S.

RUNNING A STRING of movie theaters is dicey in the best of times. Not only must you book the most profitable movies; you also have to negotiate and track arcane formulas to split the take with movie studios, attract the crowds, sell the concessions and manage your cash. That's especially tough in a market so overbuilt that many of the biggest players have filed for bankruptcy protection.

The main problem is knowing how much money you're taking in and how much to put aside for the studios. Put aside too little, and you have to make it up later; too much, and you have to borrow to keep the business running.

"You're constantly in a battle to manage your cash," says Alan Davy, executive vice president and head film buyer at Edwards, a \$350 million chain.

Until a few years ago, Edwards did that with "pencil and pad and clerks in green eyeshades," says Davy. Aside from a 1.D. Edwards & Co. accounting system used to cut paychecks, the operation had almost no computers.

One of the first jobs facing Coates when he became the company's first CIO was to automate that process — both to save money and to give managers a tighter grip on the business.

Although he had no legacy systems to add to his headaches, Coates had to convince senior management to pay for a cash-flow system, a standardized point-of-sale system and a wide-area network to connect them. He also had to push for standardized business practices so the results would make sense. His task was complicated by the fact Edwards had filed for Chapter 11 bankruptcy protection in early 2000 (it emerged from bankruptcy in September 2001).

The result was a cash-flow automation system nicknamed RITA (for reliable, integrated, timely and accurate) that was built in Visual Basic 6 on top of a SQL Server 2000 database. Theater managers upload results nightly, and the system calculates revenue and payments due to studios and shunts data into a data mart and a series of reports that give managers online access to current results. Development started in November 1999 and was completed in December of last year at a total cost of about \$1 million, Coates says.

"The old way was a monotonously cumbersome system," Davy says. "Now, I can do most of it online and make changes quickly." ▶

## Fran Dramis

**I**N FEBRUARY of last year, BellSouth had a choice: hobble forward on a legacy customer ordering system or invest in a new one that would better support thousands of new broadband subscribers — a linchpin customer segment in the company's revenue strategy.

It may sound like a no-brainer, but given the post-dot-com capital constraints plaguing the entire telecommunications industry, it was anything but an easy decision.

Following Dramis' technology transformation road map — which he designed to help business units define the systems they need to build revenue — BellSouth ultimately got the new ordering system.

It took nine months to implement a customized version of Oracle Corp.'s customer relationship management software, which was integrated with proprietary ordering features in other BellSouth systems. This gave new subscribers the ability to order and even self-install the software they would need to get up and running on the Asymmetric Digital Subscriber Line

(ADSL) high-speed service.

The result: By year's end, BellSouth's broadband customer base had grown from 200,000 to 660,000, with 90% of customers using the self-service option. The effort has also resulted in a 50% decrease in per-subscriber ordering costs because the new system supports more customers at a lower cost than the previous one and captures more customer information. That, in turn, works to reduce the number of help desk calls that have to be fielded and helps to identify new services and capabilities that customers want.

One new service is a telecommuting billing option, which lets companies aggregate billing for ADSL services they provide to remote workers.

"All of this allowed us to increase customers at fairly negligible systems costs," says Dramis. "And these are all things that help the growth activities of the business."

For example, he says, just a few years ago, the company's annual ADSL revenue generated no more than "a couple of million dollars." This year, it's a half-billion-dollar business for BellSouth.

"What Fran really does is set the strategic direction," says Lori Groves, the project leader on the ADSL ordering system project. ■

## Paul McKeon

**SUCCESS IN PUBLIC RELATIONS** depends on close working relationships with clients, thorough knowledge of their needs and quick access to information and expertise. Ketchum needed a knowledge management system that would leverage staff expertise, personalize in-

formation and increase collaboration. McKeon's team replaced a first-generation, one-size-fits-all Intranet with an intranet/extranet knowledge management portal that customizes information based on user needs. The portal gives all Ketchum professionals and some clients access to information about the firm's staff and resources based on their profiles, and it's customized for foreign-language clients. It also features eRooms, virtual workspaces where clients and staff can collaborate online. The system includes a knowledge base of information from 7,000 documents and a catalog of staff expertise and client engagements. Employees are encouraged to contribute to the knowledge base, and performance reviews are tied to their contributions.

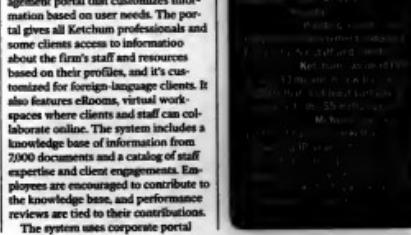

The system uses corporate portal

software from Plumtree Software Inc. in San Francisco, collaboration software from eRoom Technology Inc. in Cambridge, Mass., and a customized SQL Server database.

The system "summarizes in 10 minutes what would have taken a couple of weeks of phone calls and research," McKeon says. Less than a year after implementation, staff and clients were sharing more than 400 eRooms.

The project began in January 2000, and the first phase was completed on time and within budget in November 2000. An upgrade was completed in September 2001. Monthly metrics track 30 parameters, including page views, feature use, contributions and eRoom use. According to surveys, staff reaction to the system is 95% positive. ■

**W**HEN CIO TOM MURPHY came to Royal Caribbean Cruises Ltd. in April 1999, the company's IT workforce was as diverse as they come. Employees hailed from more than 40 countries, and nearly half of them were minorities or women.

But IT management was floundering. "I want to be honest with you," President and Chief Operating Officer Jack Williams told Murphy. "IT is screwed up."

"It was a very traditional IT organization: command and control. Everything was locked down; everything was about not spending money," Murphy recalls. "The gentleman who was here before me was a great guy, but very timid, and the CFO basically ran the place."

"It was a traditional '70s data processing shop," Murphy says. Cost-cutting was the mantra. Voice mail was new, and the cruise operator was only dabbling with e-mail. There was no IT strategy for the future and no respect from the business side.

Adam Goldstein, senior vice president of total guest satisfaction, was "vitriolic in his disdain for all things IT," Murphy recalls, and he wasn't alone. "To a person, the business had absolutely lost confidence" in the company's IT department, he says.

"No matter what we did, it was never right," recalls IT Director Percy Lopez.

Internally, the IT group was made up of factions and morale was terrible. Wined around the department was that two opposing "mafias" — Cuban and African-American — controlled the data center and the networking group. "Each department in IT did its thing and didn't want any involvement with the others," says IT manager Dennis Wright.

"It was an emotionless, beaten-down group," says Murphy, who had come from well-oiled, homogeneous IT machines at Marriott International Inc. and Omni Hotels.

# All Hands On

Royal Caribbean CIO Tom Murphy is pulling together diverse groups. By Kathleen Melymuka

## AT A GLANCE

### Royal Caribbean Cruises Ltd.

#### LOCATION Miami

EMPLOYEES 27,000

IT EMPLOYEES 400\*

NET INCOME \$324 million

GROSS REVENUE \$3.3 billion

FLEET 23 cruise ships, 47,400 berths

\*For four quarters ended Sept. 30, 2001

Note: Royal Caribbean is currently negotiating for a merger with P&O Princess Cruises PLC, a London-based cruise line with gross revenue of \$2.45 billion.

Almost three years later, everything has changed. Silos and resentments have disappeared, and the IT group has become phenomenally successful. Murphy personally sold the board of directors on a \$100-million effort called Project Leapfrog aimed at pulling Royal Caribbean into the 21st century.

Since then, the firm's IT group has been overhauling the entire IT infrastructure. This effort includes a PeopleSoft enterprise resource planning implementation, a revamped public Web site and additional automation to facilitate shipboard and shore excursion activities.

These days, the IT department is respected by the business and proud. "I never doubted that he would transform the organization," Williams says. "But [Murphy] did it quicker than I thought he would."

Murphy, 39, insists that there's no magic formula for getting a diverse group to pull together. "All I do is try to create the atmosphere and the environment that allow people to be successful," he says. "It has zero to do with where they came from or what color

their skin is. You just remove the barriers and watch people blossom."

When pressed on the point, he acknowledges that there's one more thing that contributes to harmony in a heterogeneous workplace. "Integrity establishes a foundation for everything that you do," he says. "If you don't have that, you have nothing."

The folks at Royal Caribbean watch this play out at work every day. Here's their account of how Murphy manages diversity:

**Communication.** "He communicates all the time, everything to everybody, and that prevents silos," says Leigh Baker, manager of shipboard applications delivery. "Silos still arise around projects or products, but as long as he's communicating the same message and the same goals to everyone evenly, then no one can use information as a weapon."

"You see him almost every day at the cafeteria, just chatting," says IT Director Julie Ponder. "He makes himself accessible."

"He interacts with everybody at the same level," says systems analyst Mike Kardini. "It gives me a warm feeling that he's taking the time to get to know me. And the way Tom interacts with employees, he sets an example. And it gets picked up."

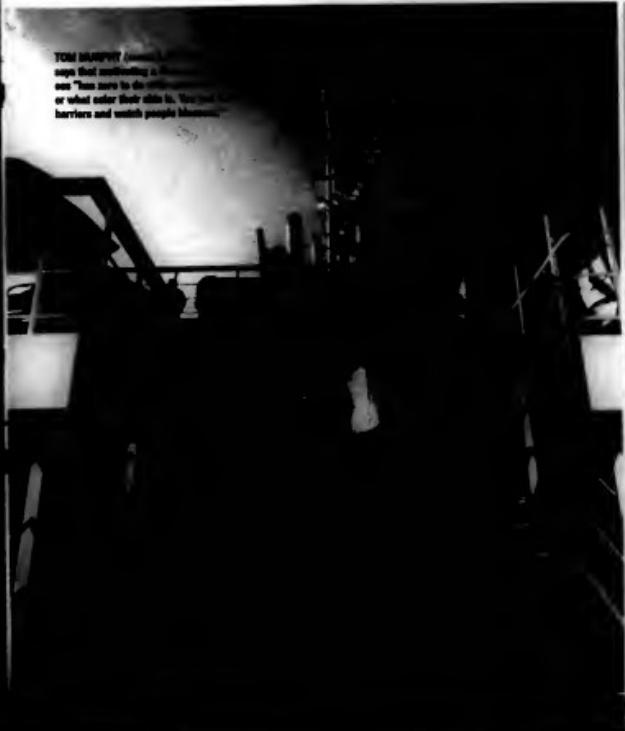

**Silo-busting.** "Before Tom, there was more 'us vs. them' in IT — 'Everything for my group,'" Baker recalls. She notes, for example, that shipboard and on-shore IT people didn't mix. "But now we're forced to work in cross teams to bring out a product, and the result is to break down the silos," she says.

**Motivation.** "He knows at least 80% of the people in the department, and he adapts based on the person," Lopez says. "He can relate to what motivates them, really people around him, and get the staff to believe in what we're trying to accomplish."

"He's such a positive person, and he instills that," says IT manager Eleana Gonzalez. "You see him

# BUSINESS CAREERS

**TOM MURPHY** (center) says that instituting a "no one" rule to do otherwise or what color their shirt is. "You just break down barriers and watch people blossom."

with this positive energy, and that goes out to the environment."

**Trust.** "We don't have to check back every 10 minutes," says Baker. "It used to be 'Don't breathe without getting permission.' Now, it's 'You know the parameters; do what you think is best.'"

**With authority comes responsibility.** "You're held accountable for your decisions," Wright says. "You're going to be helped through the bad ones and recognized for the good ones."

Murphy strikes the right balance between nurturing his people's independence and growth and supporting them. "I never get the sense he's looking over my shoulder," says Ponder. "But I do have the sense that if I look behind me, he'll be there, championing my cause. It's very empowering."

**Motives and time.** Murphy has established very specific performance measures to let his managers know exactly what's expected of them. He's also centralized administrative responsibilities to give managers more time for their people.

"We used to spend a lot of time with vendors and [make] arrangements for training and travel," says Gonzalez. "All that was removed and given to other areas so that we could focus more on the people."

**Respect.** "The change has been profound," says Goldstein, no longer vitriolic. "I give Tom tremendous credit for turning around the organization and making it extremely service- and customer-oriented. Instead of being seen as an obstacle, it's seen as an asset to business."

This new respect makes the IT team proud of itself. "We have a great working relationship with the business now," Lopez says. "They respect us, they look to us, and that raises morale on the staff."

Murphy fosters IT pride with team-building activities. IT staffers paint and help landscape at the Broward County Children's Society Home, clean up local creeks and help build a house each quarter with Habitat for Humanity.

**Fun.** "He's a funny guy, and his sense of humor adds to his ability to bring diverse people together," says Ponder. "He's always trying to get us to ease up and relax."

**"He's just himself,"** says Lopez, "and that lets people be more themselves and have some fun while getting the work done."

**Leadership.** "He's not just a leader; he's a role model," says Ponder.

And he has modeled the concept that everyone leads and everyone works. "If there's work that needs to be done — even at a lower level — he rolls up his sleeves," says Gonzalez. "He'll get in there and help."

For instance, Bernard Gay, vice president of IT, says he once found Murphy moving equipment with a dockside crew to speed up the processing of cruise ship passengers. "Tom is not afraid to help," he says, "and so I have to get down and dirty to deliver, too. There are no excuses here."

"Tom's not a good IT leader; Tom's a great leader," says company President Williams. "People really love this guy. Someday he will be the president of a company, and it will be a great company to work for."

# In Deck

**You're about to stick your neck out on a**

server decision that will finally update your data center. The problem is, it's hard enough predicting what will happen next quarter, let alone next year. So how can you be confident that the infrastructure choices you make today are choices you can live with tomorrow?

One option now has to include the new HP server rp8400—a rack-optimized breakthrough designed specifically to help you manage the enormous infrastructure demands generated by today's constantly evolving business environment.

It's small enough to fit two to a rack yet provides unprecedented power and flexibility in a mid-range server. In fact, we've made room for up to 16 processors, setting new standards in the category for both performance density and scalability. The kind of power you need to more easily manage and control workload allocation.

Best-in-class dynamic partitioning essentially divides the server into sections, allowing each one to function independently. So even if one application goes down, the other sections of the server continue their jobs unaffected. Which makes it possible to move resources around without having to shut down your entire system, sidestepping costly downtime.

And with the convenience of HP Utility Pricing, processing power and other services can be made available on tap, like electricity. So you can easily and securely scale online without having to invest in expensive hardware or support.

HP infrastructure solutions—servers, software, storage, services and beyond—are engineered for the real world of business. Because the last time we checked, that's where we all work. Call 1.800.HPASKME, ext. 246. Or visit [hp.com/go/infrastructure](http://hp.com/go/infrastructure).

Infrastructure: it starts with you.

# Managing Einsteins And Leaderless Teams

**New tomes on how to motivate and lead whiz kids, guide a 'conductorless' IT team and manage projects.**

**Leadership Ensemble: Lessons in Collaboration Management From the World's Only Conductorless Orchestra,** by Harvey Seifert and Peter Economy with J. Richard Hockman (Times Books, 225 pages, \$25). On the surface, the Orpheus Chamber Orchestra in New York appears to be leaderless. There is

no conductor keeping tempo with a baton to signal crescendos from the strings or decrescendos from the brass. In the orchestra, far from leaderless, as Hockman learned from studying how each member

takes responsibility for ensuring that musical passages are cohesive and that no single section draws out the others.

There's a certain kind of democracy demonstrated here from which IT managers and technicians alike can draw lessons. Just as members of a project team can, Orpheus musicians recognize that there are differences among players in their experiences, musical perspectives and abilities. In Orpheus, a player's input in a musical decision isn't based on age, gender, position or how loudly he speaks. It's determined by what he has to offer to the music.

Seifert, the executive director of Orpheus, and Economy, the author of *Managing for Dummies*, do a deft job of drawing analogies to other companies, such as New York-based J.P. Morgan Chase & Co., which grants employees wide-ranging autonomy to pick and

choose from the company's many products and how they're presented and sold to clients. There are plenty of practical tips on how to foster "horizontal teamwork" and deal with issues such as aggressive employees who "hijack" the team process.

— Thomas Hoffman

**The Project Manager's Partner: A Step-by-Step Guide to Project Management (2nd edition),** by Michael Greer (Amacom Books, 292 pages, \$24.95). The recession has put its share of pressure on IT organizations, especially in the form of requiring more disciplined project management. This Greer's third book on the subject, is especially focused on rookie project managers.

The book covers project management from soup to nuts and is dotted with several easy-to-understand forms and tables that can guide you through a project. It also offers questions for readers to answer in order to determine whether a project has passed certain checkpoints.

Don't skip the introduction: Reading it can help you pick out the parts of the book you may not need to read, given your project management experience — or lack of it. Also, check out Appendix E, which outlines six guidelines that can help you decide whether to kill a project. After all, if a project merits a death sentence, there's no sense in wasting your company's money today.

— Rick Sias

**Project Management is a Contact Sport,** by Jim Richardson and Augusto Videiros with Tom Gorman (McGraw-Hill Professional, 257 pages, \$24.95). Many people regard Albert Einstein as the greatest scientific

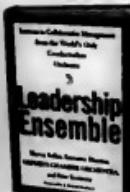

mind of the 20th century. In addition to his intellectual superiority, Einstein was recognized as an outspoken critic of bureaucracies. Much like their predecessor, today's Einsteins are highly intelligent, possess revolutionary ideas and abhor authority exerted over them by bureaucratic managers.

The authors, who are professors of management and entrepreneurship, respectively, at the University of Houston, do a credible job of offering suggestions on how to profile, recruit, motivate, reward, lead and even discipline Einsteins.

Though Ivancevich and Duening drew on a fair amount of clinical research and insights from experts such as *The Wall Street Journal's* Sue Shellenbarger, some readers might be put off by some of the sweeping generalizations the authors use to classify the makeup of an Einstein: "Einsteins love novelty... Einsteins are puzzle solvers... Einsteins become bored with routine." Who doesn't?

Still, there's a lot of practical advice based on different management methodologies, such as balanced scorecards that should help IT managers who are struggling to manage and lead the latest crop of whiz kids.

KATHLEEN MELYMUKA/DIVERSITY

# The Glass Ceiling: Barrier or Challenge?

**I**'VE ALWAYS BEEN STRUCK BY how neatly many IT women seem to fit into one of two categories that I call "Woe Is Me" and "Says Who?"

When women in the first group bump against perceived gender barriers — the condescending boss, exclusion from the boys' club or the fact

that no woman has ever led a big project — they whine. Those in the second group perceive those barriers as challenges and overcome them.

This isn't to condone gender bias in IT or to recommend that we ignore it. But it has always been fascinating to me to see some women seem to fixate on these barriers, while others focus on the goals beyond them.

I was recently reminded of this dichotomy by a new study from Catalyst, a New York-based nonprofit research firm dedicated to advancing women in business.

The report, "Careers in High Tech: Wired for Success," was based on comprehensive interviews with 19 women and 11 men considered to be part of the current and next generation of IT leaders at 10 high-tech companies, including AOL Time Warner, Hewlett-Packard, Oracle, Novell Networks and Yahoo.

Here's what these IT leaders look like: The majority are 40 to 44 years old (seven are under 35). Twenty-seven have bachelors' degrees, and 14 have graduate degrees. Eight are minorities, but none is black or Hispanic. Eighteen have children.

Most report directly to the CEO or the level immediately below. They have titles like group product director, vice president of software development, group manager for optical Ethernet, senior technical director, vice president of global services, and vice president of strategy and corporate operations. These are people who are making things happen in U.S. technology.

Catalyst had hoped to shed some light on common career paths of successful women in IT. Instead, it found that the women themselves discouraged that kind of approach. Most warned against a pre-conceived set of steps, saying that the IT industry is chang-

ing too quickly for any pre-planned strategy to work. In fact, the study busted the myth that the most successful people plan their careers. It turns out that some plan, but most don't.

The study also found that a technical degree isn't a prerequisite to success in IT. Fewer than half of the IT leaders who participated in the study have math, engineering or computer science degrees. So the fact that young women tend to shy away from technical studies — long used to explain their absence from IT's executive ranks — may not be such an important factor, according to the Catalyst report.

"There is no necessary or preferred starting point for careers in high tech," the study reports. "Several went direct to the goal, others followed a circuitous route, [and] still others began their careers through discovery and experience."

Though they couldn't come

up with a road map, male and female IT leaders agreed about how to power yourself down whatever road you take. While IT women often gain these types of insights from mentors, women — who often lack mentors — may not. They suggested the following:

- Dig deep into your chosen area of expertise in the first five years of your career.

- Build a track record in a given functional area and establish your credibility.

- Learn to manage a small group.

- Increase the scope of your people management skills, the size of your team and the complexity of the task for which you are responsible.

- Consciously explore other functions.

- Gravitate toward the visible, difficult, strategic tasks.

- Deliver, deliver, deliver. Performance and results are paramount.

Participants also talked about the importance of flexibility and social networks. They said IT is an open and fluid environment, so you need the flexibility to jump in when you see opportunities. Keeping in touch with past employers and colleagues is critical, they said, because you can never tell where that next opportunity is going to

come from.

Many of the respondents said that finding a mentor is the key to discovering how the system works. With the benefit of 20/20 hindsight, the women said they would have done some things differently.

"I would have learned how to work the system sooner,"

said one. "I didn't understand the importance and power of politics," said another. "I could have been far more effective in using networks. I could have better understood how to use or get resources."

But among all these interesting insights, the one I was most struck by was how women

who are IT leaders reacted to the glass ceiling: They either turned what some would perceive as disadvantages to their advantage, or they simply refused to accept the barrier.

"For much of my early career, I was the only woman," said one. "But it was always an opportunity for me. It gave me a level of visibility that I wouldn't have had."

Another woman said that the glass ceiling is "like an invitation with me. If someone says, 'You can't do that,' then I go [do it]."

These are the attitudes that make an IT woman into an IT leader, and these women's successes prove it. ■

## EXECUTIVE TRACK

**CPW Computer Centers Inc.**, a multitenant technology provider, has named JONATHAN J. STEVENS its CEO. Stevens will be responsible for overseeing the Vernon Hills, Ill.-based company's IT and e-business strategies.

Stevens joined CPW as vice president of IT in July last year. Before that, he served as regional technology director of America West, a Seattle-based technology integration company formed through an alliance between Microsoft Corp. and

Hammond, Bermuda-based Accor-

ture Ltd.

Irving, Calif.-based Maxis North American Operations recently announced the appointment of JAMES A. BIMARZO as its COO and director of IT.

Bimarzo was most recently senior vice president and CIO at Agency Holding Co., where he was responsible for the management of information systems for two compa-

nies: general manager of IT at London, Md.-based Land Rover North America Inc.

La Mirada Hotels and Resorts in London has appointed JAMES LAMB its COO.

Lamb has spent the past 12 years at Dallas-based Perot Systems Corp., where he most recently served as site manager of the company's Houston Development Center in Houston, Va.

Lamb's previous experience at Perot includes the management of Whistler Hotels & Resorts' worldwide technology center in Salt Lake City. He also led the development of a

new central reservation system for Tulsa, Okla.-based automobile rental company Dollar Rent-A-Car Systems Inc. and Thrifty Rent-A-Car Systems Inc.

FirstEnergy Service Co., a subsidiary of FirstEnergy Corp. in Akron, Ohio, has promoted KEVIN J. KEOUGH to the position of senior vice president responsible for information services, performance planning, supply chain and telecommunications.

All Jeannine, FirstEnergy Service's COO, will report to Keough. Keough previously served as vice president of e-business strategy, business planning and consolidated ventures at the energy services provider.

In his new role, Keough will report to CEO H. Peter Rizzo. Prior to joining FirstEnergy, Keough worked in the Cleveland office of New York-based McKinsey & Co., a management consulting firm.

As a partner in McGraw's electric power and natural gas practice, Keough assisted clients with strategic, operational and organizational issues.

# “Dear Career Adviser:

*I'm preparing for a layoff. What do I need to do to make sure I wrap up my current situation before I move on?*

— LOOKING FORWARD

## Dear Forward:

Here are some tips from a variety of folks who have already gone down this road:

Begin by documenting the dollar amounts owed to you concerning wages, bonuses, commissions, overtime and vacation pay. Document your retirement monies, making sure that any payroll deductions for your retirement plan and 401(k) cafeteria benefits plan have transferred over to your individual retirement and benefit accounts and that they aren't stuck in company

coffers. Also, document any stock or other awards, including stock vesting schedules. Be sure you know and have direct contact with your company's 401(k) administrator, have confirmed that your health insurance is in force and will continue under COBRA, and have access to any outplacement services the company is providing.

Get all of this, as well as a written payment schedule regarding when to expect your checks, in writing, and have the company sign off. Then head over to the state unem-

ployment office, making sure the company backs your claim.

Before your final goodbye, collect personal information from colleagues so you can generate the appropriate references and trade leads, and check with your attorney regarding whether the noncompete agreement that you signed when you joined the

company still applies if you're being let go.

## Dear Career Adviser:

I'm a senior programmer/analyst with 12 years' experience in IT, all in mainframes. I update my skills every year in areas including Visual Basic, MSAccess, PowerBuilder, HTML, Active Server Pages, Java and Oracle PL/SQL. But I have yet to find a position

where a novice is accepted. What skills should I pursue, and how do you see the mainframe IT market in the next five years?

— MOSTLY MAINFRAME

## Dear Mostly:

Companies have already finished converting from old legacy systems,

and Y2k is over. And e-commerce jobs require real-world experience with Enterprise JavaBeans. Plus, you have lots of competition both from existing mainframe people and people who have real-world experience with newer skills.

"We haven't had a mainframe position in this area in a long time," says Brett Arnold, recruiter at CDI Professional Services in Springfield, N.J., where most of the mainframe market is continuing to wane.

Realistically, your best chances now are in situations that others might not want. But what you're looking for is an entry point that's your opportunity for an upward move.

If the company is continuing older applications, volunteer to be on the team. Take courses at schools that guarantee internships and placement, and upgrade your skills, your understanding of business and possibly even your appearance. \*

## WORKSTYLES

# Building on IT At Barton Malow

*Phil Go, CIO at Barton Malow Co., talks about how IT workers fit into a major construction firm.*

**Being in the construction field, is there anything unique about your actual workplace?** "We just moved to a new headquarters designed by our internal architectural firm and built by Barton Malow, and it's a showcase of what we do well. When you walk in the building, there's a four-story atrium, and it's so bright — especially in winter, when we're lucky to get a couple hours of sunshine. We also face the wetlands, with a long boardwalk that allows you to enjoy it.

"The building was also de-

signed to use IP, so when people leave me a voice mail or send a fax, I get it in my in-box."

**What are the most critical systems supported or developed by your department?** "One is our project management system. We have two versions: [application service provider]-driven and internally hosted. The second is our job-costing system, which is specific to the construction industry. Whenever either of those systems has a small hiccup, it's the end of the world."

**What's unique about your IT department?** "Part of our IT strategy is to be the best there is in the construction industry, which tends to be a

biz stodgy when it comes to technology. We just finished putting together a data collaboration system using PictureTel technology. Not only can you see each other when you talk on the phone, but there's [also] a second monitor that's a PC, which allows project managers and marketing people to collaborate on things like proposal development. It's impressive to clients."

**How would you describe the pace of the work?** "Extremely

hectic but fun. You have to do whatever it takes to get the job done, within reason. One thing I pride myself on, though, is I'm very sensitive toward peoples' personal lives. For me, work is not a place — it's an activity. You don't have to be in the office to get your work done."

**How would you describe the overall culture of IT at your company?** "Somewhere in between casual and formal. A few years ago, Barton Malow was a very conservative

firm, and people dressed that way. When I started, the IT staff asked if we could go to business-casual dress, and we were able to do that. But we're not too formal — the leaders here are very approachable, and we foster an environment that makes it a fun place. We do things outside of work — I got married a year and a half ago, and I invited the entire staff."

**What aspect of work do you look forward to each day?** "It's very rewarding when you introduce a new type of technology to a stodgy company and see the light bulb go on, even though it sometimes takes three or four tries before they say, 'Oh, this makes sense.' "

**What aspect do you dread each day?** "The corollary — that sometimes it takes three or four times for them to get it. That can be frustrating."

— Mary Branda  
[branda@real.com](mailto:branda@real.com)

### Barton Malow Co.

**Who they are:** A \$1 billion construction management firm.

**Main location:** Southfield, Mich.  
**Number of IT employees:** 25, with roughly half in application development and half in tech support.

**Interviewee:** Phil Go, CIO

## THIS WEEK

### FIELD REPORT: NAS

Network-attached storage (NAS) is no longer an ad hoc, departmental storage add-on — it's becoming a serious top-down enterprise storage resource. We take a multifaceted look at the technology. **PAGE 40**

### EMERGING TECHNOLOGIES

The new iSCSI standard paves the way for IP-based storage-area networks (SAN), but don't boot Fibre Channel from the data center yet. Performance, stability and interoperability are still evolving, as are IP SAN management tools. **PAGE 44**

### HANDS ON

Virtual machines that can concurrently host multiple operating systems may reduce your backup footprint and software costs by as much as 70%. The downside? A slight performance hit. **PAGE 44**

### QUOTE OF THE WEEK

Think of netiquette as rules of good behavior adapted for electronic communications via e-mail, instant messaging, chat rooms and discussion forums. Find out more in this week's primer. **PAGE 48**

### SECURITY JOURNAL

Mathias Thurman's token-based access system may protect his company's e-commerce site, but the network engineers oppose it. Should he give in or fight? **PAGE 50**

NICHOLAS PETRELEY

## No .Net Advantage

**N**OW THAT Visual Studio .Net has launched (on Feb. 13 — that wasn't a Friday, was it?), will someone remind me why .Net is destined to revolutionize Web services?

Let's look at what .Net brings to the table. First, .Net relies on standards such as XML, SOAP and UDDI to make it easy

for networked objects to discover other networked objects and communicate with them.

Second, the .Net framework is programming-language-neutral. The .Net environment includes the Common Language Runtime and the Common Intermediate Language, also known as Microsoft Intermediate Language, abbreviated MSIL or IL, depending on the time of day. This acronym soup makes it possible to combine C#, C++ or Visual Basic .Net (VB.NET) programs as if they were all written in the same language. In other words, the moron down the hall who can't learn anything more complicated than Basic can write VB.NET programs that make direct references to classes and methods in your C++ program.

Third, Microsoft says it gives you all the tools you need to help you create "platform-independent, standards-based, language-neutral" .Net Web services. For example, you get tight integration with Microsoft's Internet Information Server (IIS) and built-in access to HailStorm, Passport and other Microsoft services.

Fourth, we have Visual Studio .Net itself. This integrated development environment supports Microsoft's C#, C++ and VB.NET and is decked out with handy tools to help you create Windows-specific front ends for .Net applications.

Let's see if we can figure out which of the above features is most likely to revolutionize Web services.

Unless you were born yesterday, I'm sure you realize that Web services is just a trendy term for distributed computing. Back when we called it distributed computing, the Common Object Request Broker Architecture (CORBA) seemed to be the ideal foundation. You can use any language you want to create CORBA objects, and CORBA is truly multipurpose, as opposed to ActiveX, which is Windows-centric.

Then came Java, Java's platform neutrality made it highly scalable, but Java's early answer to distributed computing was a primitive feature called Remote Method Invocation. This feature was easy to implement, which made it attractive despite the fact that it was a Stone Age

tool compared with CORBA. It almost looked as though CORBA would make a comeback when Sun added CORBA-based Internet InterORB Protocol support to Java. But the protocol proved to be harder to learn and implement than XML, SOAP and UDDI. As a result, Java developers seem to be going with XML, SOAP and UDDI.

Black to .Net. What is it about .Net that will revolutionize distributed computing? Its language neutrality? Integration with Microsoft software and services? The Visual Studio .Net development environment?

Given the choices programmers have been making so far, it's difficult to imagine that they will switch from a platform-neutral, single-language, highly scalable solution like Java to a single-platform, multilanguage solution with limited scalability. (Microsoft is marketing .Net as multiplatform, but anyone who believes that should revisit the issue after sobering up.)

Language neutrality is cool, but as nifty as it might be to be able to reference a C++ class directly from a VB.NET program, the more languages you add to a project, the more difficult that project is to maintain. But there's one simple reason why you can be sure language neutrality won't revolutionize Web services: It has nothing whatsoever to do with Web services.

What's left? Considering Microsoft's less-than-stellar reputation for security, I don't think developers are going to flock to .Net because it's tightly integrated with Microsoft IIS and Microsoft services such as HailStorm and Passport. So it's safe to cross that feature off the list.

And no matter how terrific the visual tools may be, it's hard to believe a glorified text editor could revolutionize Web services. So I think we can eliminate Visual Studio .Net as the answer.

This leaves the fact that .Net supports XML, SOAP and UDDI. Of all the features of .Net, that support is what has the potential to revolutionize Web services. Problem is, these standards existed before .Net, and you don't need .Net to use them.

So will someone remind me why .Net is destined to revolutionize Web services?

# TECHNOLOGYFIELD REPORT

## Overview Network- Attached Storage

**Network-attached storage (NAS)** is quietly transitioning from an ad hoc, departmental storage add-on to a serious top-down enterprise storage resource. This highly reliable file server approach has always been relatively inexpensive and easy to configure and manage. But now, a single NAS server accommodates tens of terabytes of data, and NAS systems sport more efficient backup technology and support applications more efficiently over today's faster Gigabit Ethernet networks. What's missing? Better tools to manage across distributed NAS resources.

**By Robert L.  
Mitchell**

### Bigger and Bigger

#### TECH CHECK

WHILE STORAGE-AREA networks (SAN) have been getting all the attention, network-attached storage (NAS) has been quietly breaking all the rules. Essentially a plug-and-play disk storage subsystem with embedded file-serving software, NAS technology was originally seen as an easy way to add a few hundred gigabytes of storage to a LAN. Two years ago, such boxes might have scaled to 0.5TB. Today, a single NAS system may support as much as 30TB.

Data backup was supposed to be a big problem for large NAS devices due to network congestion. But thanks to adoption of the Network Data Management Protocol standard and technologies such as Sunnyvale, Calif.-based Network Appliance Inc.'s SnapShot feature (which creates a copy, or "image," of the file system and associated disk block mappings), that's changed. Today, you can run NAS backups over high-bandwidth Gigabit Ethernet networks quite efficiently.

NAS devices have traditionally served up files to end users, while SANs have allowed application servers to access disk storage without a server intermediary and send it in an efficient block-data format over Fibre Channel, a dedicated, high-speed serial interconnect. But NAS is now well established for adding capacity to e-mail servers, Web server farms and SQL and Oracle databases, where clusters of NAS devices can increase availability and throughput.

Data center applications such as online transaction processing still work better on SANs, which offer high scalability and faster performance, especially for large files or where storage traffic is heavy. But even "some block-level applications, like an Oracle or IBM DB2 database, are adopting a file system to replace the block storage technique," says Jon Toigo, an independent storage consultant in the Tampa Bay area. "There is a certain convergence going on, and NAS is well positioned to take advantage of it."

NAS servers are relatively easy and inexpensive to install, and users say they've been highly reliable. "NAS is great because you can distribute it all over the place, and you can manage it from one location," Toigo says.

NAS is not without its limitations, however. Most servers use a Web management interface, which works fine for a single device. But as the systems reach capacity, administrators must add new NAS systems. The problem: "You've got to surf the [indi-

vidual] Web pages associated with each NAS box to maintain them. That's a hassle," says Toigo.

Then there's storage virtualization. A single NAS server allows multiple disks to appear as a single virtual storage volume to end users and application servers. And administrators can add hot-pluggable disk drives to the system and expand the virtual volumes on the fly, without disrupting applications using them. But these volumes typically can't span multiple NAS servers, let alone work with other vendors' NAS devices, and that limits scalability. A few start-ups have begun offering that capability, but the technology hasn't yet trickled up to the market leaders.

"NAS is a great out-of-the-box solution, but you don't have a lot of options in configuring it," says Mike Carrano, a partner in Accenture Ltd.'s New York office. That's one reason organizations aren't loading anywhere near 30TB on a single NAS device today. But users are looking for new ways to use this relatively inexpensive, high-capacity storage, and vendors are looking for new ways to accommodate them. Ultimately, analysts say, IP SANs will offer a single, virtualized storage pool for both NAS and SAN functions. Until then, users will have to make do with SAN/NAS hybrids like IBM's NAS 300G, which places a NAS front end on an IBM Shark Fiber Channel SAN to convert client file requests to block data requests. ♦

## Getting Big Files Into a Small Box

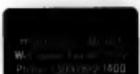

### CASE STUDY

**Who they are:** A \$2 billion independent oil and gas exploration and production company.

**Goal:** Allow geologists and geophysicists to share 1.5TB of seismic data files; consolidate back-up of seismic data and an Oracle database; improve backup performance; accommodate the purchase of large quantities of additional seismic data files with minimal disruption.

**Challenge:** An existing 5-year-old NAS device maxed out at 1TB using older 9GB disk drives. Growth in data storage needs was stretching backup times. The amount of floor space available to accommodate more boxes was limited.

**Strategy:** Replace existing NAS unit with Aspera Systems Inc.'s NS 3000 NAS device with 2TB of capacity.

**migrate to Veritas Software Corp.'s NetBackup version supporting the Network Data Management Protocol (NDMP); migrate Oracle data to NAS; deploy everything on Gigabit Ethernet.**

**Issues:** Performance differences were a key differentiator in choosing a NAS device, says Patrick Murphy, manager of IT. "Typically, seismic data comes in 40 or 50MB files," he says. By working with peer organizations and running comparative tests using his applications, Murphy found that performance varied by as much as 20% for his application needs.

**Advice:** Compatibility counts. "You have to be concerned that the backup software, file-level and backup hardware will work together," Murphy says.

**Payoff:** The new system provides more storage in a smaller footprint and allows volumes to scale to 10TB without interruption. Performance improved 10% to 20%, and backup times were cut in half. "The newer box supports NDMP," Murphy says. "It dropped our backup time by more than 50%. . . . That's mostly attributable to NDMP."

## Storage Appliances: Not All Plug and Play

### FIELD NOTES

**DON'T TELL DAN ROSENMAN** that NAS devices just plug and play. His first clustered NetApp servers from Network Appliance Inc. wouldn't work with his warehouse application server, until he discovered that the HP-UX-based system needed a patch to resolve compatibility problems with the Network File System (NFS) file-sharing software the NAS server uses.

After that, Rosenman, IT director at Fairfield, Calif.-based Jolly Belly Candy Co., ran into trouble configuring storage virtualization. The NetApp server presented its storage as a network file share, but the Oracle database software and warehouse management application wanted a drive letter. Rosenman mapped the drive letter to the new share name, but "every time a user would log off, it would break all those mappings and the system would stop working," he says. He ended up going through the Oracle latency settings for the Oracle software and the application and removing all references to the drive letter. (Network Appliance says it now lets the NAS appliance appear as a drive letter.)

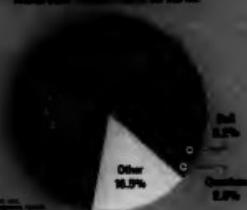

Rosenman then set up NetApp's SnapShot feature, which takes a snapshot image of the file system and data every four hours, allowing for rapid rollback in the event of data corruption. But the multiple images take up valuable disk space. Rosenman would like to take snapshots of other applications in the same volume only once a day, but the technology won't support that.

Rosenman had a snapshot problem that resulted from administrator error. "Instead of letting the system do it, we took some manual snapshots and left those in the production volume," he says. Those images continued to consume more disk space until "we filled up one of the filers and the database stopped." Rosenman had decided to pass on Network Appliance's monitoring software in favor of a plug-in for his HP OpenView management software, but he hadn't yet implemented it.

Rosenman says the NetApp file servers are "very easy to manage." He says he also found support and performance better with server-attached storage, thanks in part to NetApp's iGB cache. But appliance or not, the system requires careful management when used for mission-critical applications. ■

### NET Market Leaders by Revenue

NetApp, Hitachi and EMC represent the top three players in the market, according to Gartner's latest report. Dell and 3Com also made the list.

# Application Integration Forges Offshore Link

Refiner's project cuts training time, costs and billing errors. By Michael Meehan

## Perfecting The Pipeline

The initial implementation of an EAI project in link Tesoro's docking facilities to its back end involved running SAP ERP applications in parallel.

**H**AVING TASTED SUCCESS with a limited enterprise application integration (EAI) project, Tesoro Petroleum Corp. was emboldened to tackle linking mission-critical information silos that had never exchanged data before.

A year ago, Mark Evans, CEO at the San Antonio-based oil refiner, faced a data dilemma in Tesoro's marine services division. The process of getting diesel fuel, drill lubricants and supplies out to the company's oil rigs in the Gulf of Mexico was fraught with errors. Wrong customer numbers, incorrect product numbers, taxation mistakes and a lack of proper documentation made it nearly impossible to track what the rigs had in stock or to pay Tesoro's suppliers in a timely fashion.

In February last year, Evans started a pilot project to link the billing systems a pilot project to link the billing systems for Tesoro's offshore operations to the corporate enterprise resource planning (ERP) system from SAP AG. Previously skeptical about the ability to forge such links, Evans has since been converted into an integration evangelist.

Evans decided he needed to bolt an HTML face onto an SAP back end so his wildcatters could worry about drilling for oil rather than learning the nuances of how to fill in forms on an SAP system. Evans chose Dallas-based integration vendor Fuego Inc. and set out to reduce what would be 13 to 15 screens of work in a SAP environment to three Web-based screens.

His first order of business was to create a separate SAP instance dedicated to handling orders for the offshore

operations to run alongside the marine services division's existing SAP system.

"We wanted to make sure we weren't hammering our production and development environment, so we created a buffer," Evans says.

The new SAP instance required five new Windows NT servers. In addition, Evans' team had to coordinate LAN and directory services to make sure the field offices were sending information to the proper SAP instance before the information was imported into the marine division's main ERP system.

After six weeks, Evans had a parallel SAP environment and an HTML-based system that could execute up to 14 different SAP transactions. Fuego's proprietary component integration language translated the HTML pages into SAP business application program interfaces (BAPIs).

Evans found that the error rate for orders taken at Tesoro docking facilities dropped 60%. Training for the field employees also took only one day instead of what Evans says could have been a year of trial and error with the ERP system.

All told, the project cost less than \$100,000.

"Initially, when we went into this, you didn't know if you were going to have shelfware, but as it turns out, I particularly liked the ease of use,"

Evans says. "It really changed our thinking. Suddenly, integration wasn't a black hole that we wanted to stay away from. It stopped being this ma-

jor technical problem."

"It's been a real cultural change," he adds. "Integration now is really part of every project we intend to do, and it's all based on the fact that it's easier to do."

## Adding Layers

Although Tesoro sold its offshore drilling facilities after that project, Evans is now in the process of integrating the company's refinery control systems with the rest of its IT infrastructure. That 90-day EAI project is due to be completed this month.

Evans is creating an XML-based integration layer between Tesoro's refinery control systems and its SAP-based business IT infrastructure. Rather than use point-to-point data translation, Evans says, he wants to transform pipeline tank-gauging and treatment data in XML documents that could then be distributed to Tesoro's accounting and business divisions.

"There's all sorts of safety and regulatory reasons to improve the flow of this data," Evans says. "Until now, we haven't been able to fully understand what went out and came in each day at the refinery level. Reconciliation has been a month-long process."

Part of the reason there hasn't been that level of monitoring is that refinery systems are largely proprietary, focused on the peculiarities of operating safely in a heavily regulated industry. Those refinery systems have been "firewalled off" from the rest of Tesoro's operations, Evans says.

He had been using a Windows NT server farm to act as a data historian for the refinery operation, but it has been little more than a repository. It hasn't been able to track real-time production movement, process variables or production schedules.

One of the reasons Evans chose an XML data format was that he wants to eventually be able to push data to business partners.

Evans says much of the work has centered on load-balancing his servers both in the refinery and business systems to make sure they don't crash when they begin swapping data. Business process rules for error-handling have also been a focus.

"You've got to make sure the right people get notified," Evans says.

And all this because he learned not to fear EAI ▶

## Tesoro's EAI Pilot

**User value:** Decreased 60% for orders taken at docking facilities

**Testing time:** Reduced from an estimated one year to one day  
**Project costs:** Less than \$100,000

# Application Integration Forges Offshore Link

Refiner's project cuts training time, costs and billing errors. By Michael Meehan

## Perfecting The Pipeline

The initial implementation of an EAI project to link Tesoro's docking facilities to its back end involved running SAP ERP applications in parallel.

**H**AVING TASTED SUCCESS with a limited enterprise application integration (EAI) project, Tesoro Petroleum Corp. was emboldened to tackle linking mission-critical information sites that had never exchanged data before.

A year ago, Mark Evans, CIO at the San Antonio-based oil refiner, faced a data dilemma in Tesoro's marine services division. The process of getting diesel fuel, drill lubricants and supplies out to the company's oil rigs in the Gulf of Mexico was fraught with errors. Wrong customer numbers, incorrect product numbers, taxatio mistakes and a lack of proper documentation made it nearly impossible to track what the rigs had in stock or to pay Tesoro's suppliers in a timely fashion.

In February last year, Evans started a pilot project to link the billing systems for Tesoro's offshore operations to the corporate enterprise resource planning (ERP) system from SAP AG. Previously skeptical about the ability to forge such links, Evans has since been converted into an integration evangelist.

Evans decided he needed to bolt an HTML face onto an SAP back end so his wildcatters could worry about drilling for oil rather than learning the nuances of how to fill in forms on an SAP system. Evans chose Dallas-based integration vendor Fuego Inc. and set out to reduce what would be 13 to 15 screens of work in an SAP environment to three Web-based screens.

His first order of business was to create a separate SAP instance dedicated to handling orders for the offshore

operations to run alongside the marine services division's existing SAP system.

"We wanted to make sure we weren't hammering our production and development environment, so we created a buffer," Evans says.

The new SAP instance required five new Windows NT servers. In addition, Evans' team had to coordinate LAN and directory services to make sure the field offices were sending information to the proper SAP instance before the information was imported into the marine division's main ERP system.

After six weeks, Evans had a parallel SAP environment and an HTML-based system that could execute up to 14 different SAP transactions. Fuego's proprietary component integration language translated the HTML pages into SAP business application program interfaces (BAPI).

Evans found that the error rate for orders taken at Tesoro docking facilities dropped 60%. Training for the field employees also took only one day instead of what Evans says could have been a year of trial and error with the ERP system.

All told, the project cost less than \$100,000.

"Initially, when we went into this, you didn't know if you were going to have shelfware, but as it turns out, I particularly liked the ease of use," Evans says. "It really changed our thinking. Suddenly, integration wasn't a black hole that we wanted to stay away from. It stopped being this ma-

jor technical problem."

"It's been a real cultural change," he adds. "Integration now is really part of every project we intend to do, and it's all based on the fact that it's easier to do."

### Adding Layers

Although Tesoro sold its offshore drilling facilities after that project, Evans is now in the process of integrating the company's refinery control systems with the rest of its IT infrastructure. That 90-day EAI project is due to be completed this month.

Evans is creating an XML-based integration layer between Tesoro's refinery control systems and its SAP-based business IT infrastructure. Rather than a point-to-point data translation, Evans says, he wants to transform pipelines, tank gauging and treatment data in XML documents that could then be distributed to Tesoro's accounting and business divisions.

"There's all sorts of safety and regulatory reasons to impede the flow of this data," Evans says. "Until now, we haven't been able to fully understand what went out and came in each day at the refinery level. Reclassification has been a monthly process."

Part of the reason there hasn't been that level of monitoring is that refinery systems are largely proprietary, focused on the peculiarities of operating safely in a heavily regulated industry. Those refinery systems have been "firewalled off" from the rest of Tesoro's operations, Evans says.

He had been using a Windows NT server farm to act as a data historian for the refinery operation, but it has been little more than a repository. It hasn't been able to track real-time product movement, process variables or production schedules.

One of the reasons Evans chose an XML data former was that he wants to eventually be able to push data to business partners.

Evans says much of the work has centered on load-balancing his servers both in the refinery and business systems to make sure they don't crash when they begin swapping data. Business process rules for error-handling have also been a focus.

"You've got to make sure the right people get notified," Evans says.

And all this because he learned not to fear EAI. ▶

# Get Ready for IP SANs

BY ROBERT L. MITCHELL

**I**F A VENDOR CLAIMED TO offer a storage-area network (SAN) with the performance of Fibre Channel (FC) but without the cost and complexity, jaded FC administrators might be a hard sell. After all, FC network devices have been notoriously incompatible, expensive and complex to administer.

But IP SANs promise to change all that by implementing the Internet Small Computer Systems Interface (iSCSI) protocol, which enables SANs to operate over industry-standard TCP/IP and Ethernet.

The concept of storage networking over IP isn't new. Network-attached storage appliances have long delivered file services over IP using Network File System or other file-sharing protocols. But creating storage networks that allow highly efficient block-level transfers between application servers and shared storage pools has been the domain of FC networks — a switched, high-speed serial interconnect

requiring specialized cabling, host bus adapters (HBA), switches and management software.

IP SAN architecture, an extension of existing SCSI and TCP/IP Ethernet standards, could reduce costs by creating a unified corporate IP network that's easier to design, integrate and manage than a traditional FC SAN. iSCSI networks are also compatible with IP-based security mechanisms such as Kerberos, public-key encryption and IPsec.

Setting up an IP SAN isn't simply a matter of plugging in iSCSI-attached storage, however. While an IP SAN can run on standard Gigabit Ethernet switches, the overhead involved in processing of TCP and the iSCSI protocol can quickly overwhelm the CPU in servers with significant storage network traffic. IT man-

agers may need to replace standard Ethernet adapters with special HBAs called TOE (TCP off-load engines).

John Flynn, IT director at Minneapolis-based NRG Energy Inc., says he hopes to get by without TOEs. "None of [our] applications have high-performance I/O requirements," he says.

But Rick Halbardier, project coordinator for Washou County, Nev., will need TOEs for the IP-based tape backup SAN he's testing. "Backups tend to use all the CPU resources available to the system," he says.

Halbardier is optimistic about the emerging TOE adapters. But, he says, "I don't know that we can say it's going to be reliable until we've tested it."

It might not be compatible, either. Standards committees are hammering out iSCSI draft standards (the final version is

expected this summer), but vendors are rushing products to market. There are no standards for TOE, different vendor interpretations of the iSCSI standard could lead to interoperability problems, and no certification process exists.

And vendors have little credibility in the user community after the interoperability debacle with early FC devices.

Once the standard is stable, analysts predict, IP SANs will slowly replace FC, but users with an investment in FC are unlikely to change over soon. "You don't replace existing technology with emerging technology," says Dan Tassier, an analyst at Aberdeen Group Inc. in Boston, adding that FC now supports 2G bit/sec. speeds while Ethernet still maxes out at 1G bit/sec.

Initially, the best fit for iSCSI may be around the edges of the FC SAN, where its lower cost makes more sense. But early adopters might do well to emulate Flynn's pragmatic approach to IP SANs. By choosing FC storage arrays with an FC/iSCSI switch, he can move to FC if things don't work out. ♦

## Already To Market

A few iSCSI products are either available or will hit the market this year.

### Target Devices

**COMPANY:** IBM  
**PRODUCT:** TotalStorage IP Storage 200, an iSCSI-based storage array that can support up to 3.5TB of data.

**COMPANY:** Share Inc.  
**Mount View, Calif.**  
**PRODUCT:** Parallel IP storage array, supports up to 640GB

### Storage Switches And Gateways

**COMPANY:** Cisco Systems Inc.  
**PRODUCT:** SAN 5420 Storage Router, allows direct attachment of FC storage devices onto an IP SAN.  
**PRODUCT:** IPS 2000 IP storage switch; connects legacy SCSI storage devices to a Gigabit Ethernet IP SAN.

**COMPANY:** Nishan Systems Inc., San Jose  
**PRODUCT:** IPS 3000 Storage Switch; connects iSCSI and FC networks.

**COMPANY:** Pista Networks, Acton, Mass.  
**PRODUCT:** Powerful "carrier-class" multiprotocol storage switches that handle a large number of connections.

### iSCSI HBAs

Vendors plan to ship HBAs with TOEs and onboard SCSI off-load capabilities next quarter.

**COMPANY:** Intel Corp.  
**PRODUCT:** intends to ship an iSCSI HBA at half the cost of a typical FC HBA.

**COMPANY:** Adaptec Inc., Milpitas, Calif.  
**PRODUCT:** Uses a full off-load application-specific integrated circuit on its ASA-721 iSCSI Adapter, which it claims improves server performance by 30% to 50%.

**COMPANY:** AlteonNet Inc., San Jose  
**PRODUCT:** Implements part of the TCP function in a driver device, which allows its 1000T adapter to handle both iSCSI and normal TCP traffic.

- Robert L. Mitchell

## The Benefits Of Storage Over Ethernet

**Q&A**  
Ahmed Zaher, product line manager at Intel Corp.'s LAN access division in Austin, Texas, is chairman of the Storage Networking Industry Association's iSCSI subgroup. He recently talked with editor Robert L. Mitchell about the iSCSI protocol.

**What is iSCSI good for?** The main

concept of iSCSI is to allow people to build storage-area networks using Ethernet. If you already have a large network that is built around Ethernet, it is natural to connect the storage to that network rather than having to learn new ways to deal with storage. Smaller and medium-size organizations cannot afford the cost of Fibre Channel SANs. We expect iSCSI to be cheaper and easier to implement.

**What are the immediate benefits?** The main benefit is the long operating distances that iSCSI will bring to the table. Right now, you have to

jump through a lot of hoops to put your storage far away for disaster recovery. IP storage makes it double.

**When will the standard be final?** We will create the document [this month], and it goes into a three-month review period. Then we go into the July or August meeting and expect that we will get out with a standard.

**Does "standard" really mean interoperable?** We want to make sure products interoperate. We do not want to see the consumers get stung again by another unintended set of products

that the vendors say are OK but when plugged in don't work together.

**How will costs compare to FC?** Lower training, lower cost of ownership. The management costs will be cheaper in terms of management tools and human resources. As the product matures, you'll be able to manage the network from one window.

**Who should skip iSCSI? Where do you not need iSCSI? Operating distances and you have already invested in FC, there is no point at this moment to switch to iSCSI.**

For a one-page study, a companion to this story, interview with Nishan Systems' Tom Clark and a copy of the iSCSI standard, go to our Web site at [www.computerworld.com](http://www.computerworld.com), keyword:iSCSI

INFRASTRUCTURE	PERFORMANCE	BEST FIT TODAY
Can use existing Ethernet switches, network adapters and copper cabling	10 b/sec.; servers may require specialized TOE adapters	Outside the data center where FC SAN costs can't be justified
Requires special HBAs, switches and fiber cabling	10 or 25 b/sec.	Critical data center applications where proven technology is a must

# Virtual Recovery Via Virtual Servers

**A new approach to disaster recovery involves running multiple operating systems in a single backup server.** By Howard Millman

**I**N AN IDEAL WORLD, disaster recovery strategies would include backup equipment ranging from a single server to an entire dark data center. In the real world, you can't afford to set up an entire extra data center than you hope you'll never use. At the same time, you can't ignore the need for real-time business continuity protection. Virtual machines that can concurrently host multiple operating systems may reduce your backup equipment and software costs by as much as 70%. The downside? Accepting a slight performance hit.

Virtual-machine-based server consolidation is a technology that's almost too good to be true. Its promised savings result from combining multiple servers and operating systems into one RAM-crammed, multiprocessor box.

The chief player in this market is Palo Alto, Calif.-based VMware Inc. Its virtual machine server software can run up to 20 operating systems concurrently — including all versions of Windows, from 3.1 to XP, and many flavors of Unix — in one physical box. VMware offers two virtual server products: GSX Server runs on Intel-based machines using Unix, Linux or Windows, while ESX Server contains its own base operating system.

Similar in purpose (but not structure) to an emulator, virtual machines create independent, isolated computing environments that include a BIOS, I/O systems (serial, parallel and Universal Serial Bus ports) and support for SCSI devices, as well as full network connectivity. For mixed environments, the software supports file sharing between Linux and Windows systems using Samba.

While the servers are virtual, the benefits are real: hardware savings as a result of server consolidation and reduced maintenance expenses. A reduction in your need for physical space may not yield a direct savings, but it

can be an added advantage. Because virtual machines switch between operating systems in seconds and don't require a reboot, downtime in case of failure is measured in seconds. Also, if one system crashes, it won't affect any other virtual machines or the host server's operating system.

"As part of a disaster recovery plan, running independent multiple operating environments enables you to guarantee immediate data availability and integrity," says Jeremy Smith, president of Global Continuity PLC, a business continuity service provider and partner of VMware in England.

Liverpool, England-based beverage firm Halewood International Ltd. worked with Global Continuity to install two virtual servers using the Global Continuity/VMware technolo-

gy. Halewood's objective was to reduce the cost of backup equipment and support and to locate backup equipment nearby for easy service and testing.

Before using Global Continuity's NeverFail backup software, Halewood's IT manager, Alex Stewart, backed up all of the company's data to a digital audiotape recorder and copied databases to another server each night. That made Halewood's data secure, but the company lacked fail-safe rollover capability in case of failure. Stewart says he also worried about data integrity and the system's ability to grow.

"The cost [for traditional disaster recovery options] was prohibitive," says Stewart. "We also looked at buying a warehouse and [outsourcing] the operation. However, the building acquisition cost and regular visits to test the

equipment didn't make sense."

Stewart rolled out two dual-processor GSX Servers running under Windows NT, plus the NeverFail software. The virtual servers mirror the data stored in Halewood's primary line-of-business servers.

Preliminary savings look promising. "Overall, they are seeing a 70% reduction in costs using the GSX Server," says Smith. Halewood's one-time outlay was about \$12,000 for server hardware and \$20,000 for the NeverFail software. VMware's GSX Server and enterprise-level offerings. Halewood's systems now support more than 100 staff users, 600 corporate clients and thousands of private clients.

Although Halewood and most other customers use the system to provide zero-downtime roller protection, Smith says the virtual machines can also run line-of-business applications and deliver the same cost-reduction and space-saving advantages they do for disaster recovery. What's more, a single-server configuration can host multiple copies of an operating system, each running as an isolated application, Web server or database. This allows IT managers to use a virtual machine as a test bed to provide an extra margin of safety when testing new applications or sandboxing a potential virus.

## No Free Lunch

Because these are machines in a machine, you may experience a 10% to 15% decrease in performance for GSX Server and about a 5% decrease in performance for ESX Server. Adding RAM and multiple processors will minimize the hit. Allocating RAM to each of the running operating systems, as well as other configuration options, is handled through a management console.

I tested VMware's Workstation 3.0, a desktop virtual PC running under Windows XP. I needed at least 512MB to run two virtual operating systems, Mandrake Linux and Windows 98. Each additional concurrent operating system requires another 512MB.

While virtual machines offer a long list of benefits, disaster recovery is all about getting your data back intact and your systems restored — fast. As part of an insurance policy you hope to never use, VMware's GSX and ESX Server do provide extra protection. That was the ultimate motivation for Stewart, who says, "We have never experienced a data loss in the past — and we want to keep it that way."

Millman is a writer and consultant in Croton, N.Y.

# Netiquette

BY BRIAN BULLMAN

**A** U.S. Department of Commerce report says that more than half the nation is now online. Thus, more people than ever before are meeting one another for the first time, chatting on a regular basis and swapping ideas and opinions with perfect strangers via the Internet.

A new set of do's and don'ts — rules of polite behavior — is springing up to augment the etiquette that rules our off-line behavior. This new netiquette has quickly become a universally understood behavioral standard that transcends cultures, businesses and geographical boundaries.

Here's a brief look at some of the rules of netiquette that are becoming the norm:

**1. Don't lie about who you are.** In Computerworld.com's forums, one man recently took a very strong stance defending Microsoft. Other forum members accused him of working for a company that partners with Microsoft but not disclosing that fact. Members said they recognized the man's arguments and writing style from other forums. After the brouhaha, the offender apologized for causing trouble and vanished.

**Vanessa DiMaso,** Computerworld.com's director of communities, points out another problem with a fake identity. People form relationships in discussion groups, and you don't want to end up in a position where you have to reveal that you're not the 24-year-old roller-skating blonde you said you were.

More important, DiMaso says, such a misrepresentation of identity is simply a violation of trust, and that's never good form.

**DEFINITION**  
**Netiquette** is all about etiquette on the Internet. Think of it as rules of good behavior adapted for electronic communications via e-mail, instant messaging, chat rooms and discussion forums.

## 2. Know when to shut up.

These days, it's hard to determine when a conversation is over, according to Joseph Cothrel, vice president of research at Participate Systems Inc. in Chicago. He says we've all been in instant messaging or e-mail conversations that just keep going on and on. Do you really have to say "You're welcome" to the guy who just said "Thank you?" Sometimes it feels like everyone is trying to out-polite one another.

**3. Know when it's OK to talk.** When you first show up at a discussion forum, it's not always a good idea to plunge right in, Cothrel says. Take a

look around, and read the forum guidelines and other posts to see how the community fits together. Jumping in with a harsh opinion won't create a good first impression, and the Web, like life, is all about making a good first impression.

## 4. Check your grammar.

More and more often in discussion groups, members are chastising people who use bad grammar or misspell words. Cothrel says that nothing kills an argument for him like seeing a simple word misspelled consistently. He says you have to wonder: If people can't spell, do they really know

what they're talking about?

**5. Don't ask about e-mail you just sent.** Don't buttonhole someone in the hall or telephone him five minutes after you send a lengthy e-mail and ask him what he thinks about it. Give him a chance to read it, digest it and reply via e-mail. According to Cothrel, more and more people consider discussions about e-mail messages a waste of time.

**6. Follow threads you start.** When you start a thread on a discussion forum, especially if you asked a question, follow that thread. And if you solve the problem you asked about, tell the board. Likewise, Cothrel points out, if the advice you received from the other members led you to a solution, be sure to tell them.

**7. Don't use instant messaging for long messages.** Betsy Waldinger, vice president at Chicago-based OptionsXpress Inc., spends a lot of her day working on an online customer-service chat system that operates a lot like instant messaging. She says it's important to send short messages and to break up long ones over many screens. If you don't, she says, you force the people on the other end to wade through an overly long message — and you keep them waiting for an answer while you type.

**8. Send a message before you drop in.** At companies where instant messaging is part of the culture, Cothrel says, you should always send someone a note before dropping into his office. This gives the other person a chance to let you know if he's in the middle of something. It also saves you the trouble of walking over to his office only to find that he's gone home.

**9. Log off instant messaging when you're not using it.** I often leave my messaging program on when I'm not around and come back to find messages asking questions and other messages in which the senders ask why I'm ignoring them. One of these days, someone will send me an embarrassing message and there it will be on my computer screen, flashing for all to see. And it will be my own fault.

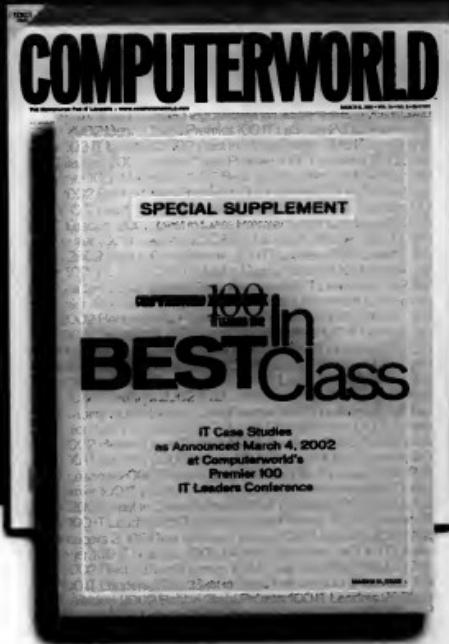

**10. Never send an e-mail you wouldn't read in public.** The night before his wedding, a Massachusetts state official sent a colleague an e-mail saying he wasn't sure he wanted to get married. Unfortunately, he hit Send All, and all state employees with e-mail accounts received the note. Boston Herald gossip reporters evidently received numerous forwarded copies, and they printed the message in the newspaper. Word is, the guy's fiancée married him anyway.

**11. Think twice before forwarding e-mail.** The jury remains out as to whether forwarding messages is acceptable. Obviously, it's sometimes necessary for business reasons, but people do it far more often than they need to. Philip Zimmermann, creator of Pretty Good Privacy encryption, has said he's not a fan of forwarding e-mails. How often would you even think of taking a handwritten letter you've received, making a photocopy, putting it in an envelope and sending it off to someone else? Zimmermann says the same thought and respect should go into forwarding e-mail. §

# Authentication Rollout Turns Into Control Issue

*When a proposed token-based access system draws resistance, Mathias must choose among lesser options*

BY MATTHIAS THURMAN

**O**NE-TIME PASSWORDS, tokens, smart cards and public-key infrastructure are all excellent methods for creating access-control architectures. My company is in the process of implementing a token-based infrastructure for access to our critical servers and network devices and for remote virtual private network (VPN) access into specific areas of our corporate network. The tokens are time-based, one-time password-generating products and are good at providing the two-factor authentication necessary for allowing access to critical devices.

Implementing security usually carries a cost. I'm referring not to the acquisition cost, but to the planning required. Take something as simple as changing the Windows NT domain password policy. The technical procedures are straightforward: It's often a simple matter of installing a product such as San Ramon, Calif.-based Master Design & Development Inc.'s Password Bouncer or PassIt.dll, which comes with Microsoft Corp.'s Windows NT and 2000.

#### Hidden Costs

However, the consequence of that policy may be an increase in help desk support calls from thousands of users who can't remember even simple passwords. Changing policy or introducing security technology often requires a considerable amount of planning. And the projects inevitably raise concerns about usability vs. productivity, convenience vs. security and risk vs. reward. The security department has to make decisions that may be perceived as impeding the company's business and operations. That's what happened in my

organization, and I'm still struggling to find a solution.

We selected tokens that are time-based and that can be used only once. The system generates a number that's algorithmically matched to a central server. A user must enter a valid passcode, which is his personal identification number (PIN) plus the number displayed on the token. Then he must wait for the system to generate a new token number before he can authenticate again.

By default, the tokens ship with the ability to generate a new number every 60 seconds. This interval is acceptable for accessing a single device or perhaps for remote VPN user authentication. But in large enterprises, users often need access to multiple devices quickly.

For example, to properly troubleshoot a network problem, a user needs access to a Domain Name System server, three routers, two switches and one firewall — a total of seven devices. If I have configured token-based access for all those devices, the user will have to wait at least seven minutes before having simultaneous access to them.

Another drawback is the use of enterprise management tools, which automatically log into devices for configuration, maintenance or monitoring. The management tools can't use the tokens for authentication. It takes human intervention to read the number generated by the token and input the correct passcode. And therein lies the rub for our internal network team.

In some high-volume e-commerce businesses, a network outage can cost a company more than \$10,000 per minute in lost revenue. Most of our business is conducted over the Internet, and I suspect our cost of lost business per

minute is almost \$5,000. But there's enough redundancy, fail-over and load balancing in our environment to ensure the required four times (99.99%) of availability.

The chance of a catastrophic outage is fairly low, but I can't convince network engineers of this. In their minds, anything that impedes access to their network gear is an obstacle that could result in unnecessary downtime.

The network team feels the token time-out issue is unacceptable and is against its use in the infrastructure. I could probably convince the vice president of engineering or the CEO of the importance of the tokens and force their use. However, doing so would create friction between the security and network groups. So we have to come up with some other options.

#### Options and Trade-Offs

Our first idea was to enable a static password instead of a passcode. The products we're using, Bedford, Mass.-based RSA Security Inc.'s SecurID ACE Server, allows the issuance of temporary passwords when a user forgets or breaks his token and needs access. Instead of issuing another token, we just issue a new password. Another benefit here is that we can embed it in the application. The problem with issuing a password, however, is that it's a departure from the two-factor authentication level of security that we get by using a token. Also, embedding a password into an application, especially a program that can reconfigure network devices, is very dangerous.

We also considered purchasing shorter 20- or 30-second tokens for the server instead of the standard 60-second ones. But that would still force users to wait before they could access another device, and it wouldn't address the enterprise management issues. Another potential problem: If the resources are in another country, the latency involved in getting packets to the devices might cause timing problems.

Another option would have been to force the use of tokens but allow the security administrator to assign a static password in cases where the engineer must access many devices in a short pe-

## THIS WEEK'S GLOSSARY

**Two-factor authentication:** This authentication method requires users to provide something that they have (a token) and something that they know (a PIN). The user enters the PIN when the token is first used. Subsequent uses require the combination of the PIN and the generated number on the token.

## SECURITY BOOKSHELF:

**Authenticating From Passwords to Public Keys,** by Richard E. Smith (Addison Wesley Publishing Co., 2001). Few books are available on authentication, but even if there were more, I would still highly recommend this title. Smith takes complicated areas of access control and presents them in an easily understood format. Along the way, he covers not only the benefits of specific technologies, but also the drawbacks.

## LINKS:

[www.microsoft.com/PasswordReview/index.htm](http://www.microsoft.com/PasswordReview/index.htm): Visit Master Design & Development Inc.'s Web site for information on Password Bouncer, a great tool for automating password security on Windows servers.

<http://support.microsoft.com/default.aspx?ProdId=MC-US-q409000>: Microsoft's PassIt.dll is supplied with Windows NT Service Pack 2. It allows administrators to implement a strong password policy without having to write their own filters.

riod of time. But since we don't have round-the-clock coverage, the amount of time it would take to get a security administrator on the phone in the middle of the night to make the configuration changes would be a problem.

Finally, we discussed scrapping the whole project and looking for an alternative. Unfortunately, we've already invested thousands of dollars in the product and support. Returning it for a refund isn't an option at this point.

So, do I force the networking guys to endure the 60-second time interval, or do I depart from two-factor authentication and assign static passwords? If you can offer a good solution, I invite you to comment in the Security Manager's Journal forum. ▶

**Quick Link**  Discuss this week's column and catch up on the latest security developments online at <http://computerworld.com/thisweek>.

You won't see the next network security threat coming.

When the next Code Red, Goner or Nimda comes along, STAT could be the difference between a crippled system and one that's completely unaffected.

## But STAT will.

Arming yourself against the next threat requires more than vigilance. It requires a new level of defense.

At Harris, we know, for more than 25 years, we've helped keep government networks secure—and now we're helping businesses stay ahead of the enemy with our STAT intrusion prevention tools. For example, STAT Neutralizer™ **proactively protects servers and workstations** by using behavioral analysis to prevent intrusions and malicious activities from taking place. STAT Neutralizer provides a new layer of security to defend your network during its most vulnerable time — **before an anti-virus update can be downloaded**. And that's just the beginning of what STAT can do. To start winning the war on cyberattacks, call 1-888-725-STAT (7828) today or visit our website.

# CONSTRUCTIVE DISRUPTION

## CTO: AGENT for CHANGE

The challenges of the CTO are unlike anyone else's. You're the one that everyone comes to for answers, solutions, predictions and miracles. As the miracle worker of your enterprise, it is your job to decipher what works and what doesn't.

Now in its 3rd year, this invitation-only conference brings together an exclusive crowd of people, like you, who are driving the use of disruptive technologies to transform business processes and define the next wave of innovation.

Join 200 other CTOs for 2½ days of networking, keynotes, panels, practical discussions, and working sessions. Share ideas and swap stories about the day-to-day challenges that CTOs face at the only event created by CTOs for CTOs.

### WHO SHOULD ATTEND?

CTO Forum is an invitation-only conference for CTOs and high-level technology executives. If you do not have a CTO title, but are making high-level technology decisions, you may still be entitled to attend.

### FEATURED SESSIONS

- **THE ROLE OF THE CTO IN TODAY'S ECONOMY**
- **DISRUPTIVE TECHNOLOGIES: FROM ANNOYANCE TO RELIANCE**
- **EXTREME PROGRAMMING**
- **GRID COMPUTING**
- **WIRELESS INFRASTRUCTURE ISSUES**
- **A LOOK INSIDE THE LABS**
- **SOFTWARE AS A SERVICE**
- **DISASTER RECOVERY BEST PRACTICES**
- **MARRIAGE OF BUSINESS AND TECHNOLOGY: CRITICAL SKILLS FOR CTOs**
- **BUSINESS CONTINUITY BEST PRACTICES**
- **IT PROJECT MANAGEMENT AND PRIORITY-SETTING IN TODAY'S ECONOMY**
- **NEXT GENERATION SYSTEMS MANAGEMENT**

### SPECIAL EVENTS

- **MONDAY, APRIL 8, 2002 PAC BELL PARK TECHNOLOGY TOUR**  
Be our guest for a behind-the-scenes technology tour of Pac Bell Park, home of the San Francisco Giants. The tour will be conducted by the SF Giants CIO and a senior IT department staff member.
  - **WEDNESDAY, APRIL 10, 2002 SF GIANTS VS. LA DODGERS BASEBALL GAME**  
Be our guest as the San Francisco Giants take on the LA Dodgers at Pac Bell Park in San Francisco.
- \* Attendance to these events is available on a first-come first-served basis. Space is limited.

## DIVERSITY IN IT CAREERS

# Sexual Orientation in the IT Field

By Jennifer Hicks

In 1990, Jane Sceniglio, a software engineer, put her name on a flier announcing a meeting of the gay and lesbian employees' group at AT&T. Later, listening to her phone message, she heard her first death threat.

"There's a wide range of reactions when you first come out at work," says Icnogle, now a distinguished member of technical staff at AT&T's spin-off, Lucent Technologies, and co-chair of EQUAL!, Lucent's gay, lesbian, bisexual, and transgender (GLBT) employee group. "There's a physical hurdle in coming out, a fear you have to get over. But the benefits are worth it. Coming out has been a positive experience."

## The Role of GLBT Employee Groups

Icnogle credits particular professional organizations (see sidebar) and GLBT employee affinity groups such as Lucent's EQUAL!, Xerox's Galaxis, and IBM's EAGLE as helping create the positive experience. "It makes a difference in how safe you feel at work and how comfortable you are in who you are," she says. "And with comfort, comes productivity. The more productive you are, the more you can contribute to the bottom line. Happy employees make for a good workplace."

Many of the top gay-friendly companies (see sidebar) understand this and have created their own GLBT groups as well.

"Inclusion, empowerment, and the ability to incorporate one's orientation into one's work" makes joining such groups professionally and personally rewarding, according to Sarah Siegel, program director, GLBT sales, at IBM and co-chair of the New York, New Jersey, and Connecticut branch of IBM's Employee Alliance for Gay and Lesbian Empowerment.

"Until sexual orientation and gender issues are a non-issue to everybody, there will always be a need

for GLBT employee support groups," says Barbara Belmont, treasurer and office administrator of the National Organization of Gay and Lesbian Scientists and Technical Professionals (NOGLSTP). "The reality is that the workplace is an extension of family for most people," she continues, "and socializing is an important aspect of team building and productivity. Another purpose is to give collective voice and personnel leverage to the often-invisible queer."

Rachelle Canuso, an information services analyst at Intel and president of its GLBT employee organization (HLBIE), agrees. "No matter how much support there may be, there is still a large majority that does not accept or understand what it means to be gay, lesbian, bisexual, or transgender. Visibility and education are the keys to promoting diversity and acceptance. As long as there are people being 'gay-bashed' or being denied promotions due to their sexual orientation or gender identity, or employees that are fearful of being/shown who they are in the workplace, there is a need for GLBT groups, both within and outside of IT."

## The Numbers

### But, just how much of a need exists?

Take a look at Census 2000. Gay and lesbian families live in 99.3 percent of all counties in the United States. There were 601,201 same-sex unmarried partner households in the United States in 2000 - a 334 percent increase from 1990.

However, a report published jointly in August 2001 by the Human Rights Commission (HRC) and the Urban Institute suggests that this number still represents an undercount of the gay and lesbian population.

While the HRC indicates that gay and lesbian families may have been undercounted by as much as 62 percent, the joint report is more modest. It puts the current GLBT numbers at five percent of the total population over 18 years of age - or 10,456,405 people - many of whom are well-educated.

And then, take a look at the employee groups themselves. EQUAL! has 1,000 members among 22 chapters and affiliates in 15 countries; EQUAL! doesn't keep a master list, but believes they have about 400 members in the U.S. alone; numbers from other employee groups are sparse.

## DIVERSITY IN IT CAREERS

# **Sexual Orientation in the IT Field**

By Jennifer Wick

In 1990, Jane Icenogle, a software engineer, put her name on a flyer announcing a meeting of the gay and lesbian employees' group at AT&T. Later, listening to her phone messages, she heard her first death threat.

"There's a wide range of reactions when you first come out at work," says Iremagle, now a distinguished member of technical staff at AT&T's spin-off, Lucent Technologies, and co-chair of EQUAL! Lucent's gay, lesbian, bisexual, and transgender (GLBT) employee group. "There's a physical hurdle in coming out, a fear you have to get over. But the benefits are worth it. Coming out has been a positive experience."

## The Role of GLBT Employee Groups

Iomigie credits particular professional organizations (see sidebar) and GLBT employee affinity groups such as Lucent's EQUAL, Xerox's Galaze, and IBM's EAGLE as helping create the positive experience. "It makes a difference in how safe you feel at work and how comfortable you are in who you are," she says. "And with comfort, comes productivity. The more productive you are, the more you can contribute to the bottom line. Many employees make for a good workplace."

Many of the top gay-friendly companies (see sidebar) understand this and have created their own GLBT

"Inclusion, empowerment, and the ability to incorporate one's orientation into one's work" makes joining such groups professionally and personally rewarding, according to Sarah Siegel, program director, GLBT sales, at IBM and co-chair of the New York, New Jersey, and Connecticut branch of IBM's Employee Alliance for Gay and Lesbian Empowerment.

"Until sexual orientation and gender issues are a non-issue to everybody, there will always be a need

for GLBT employee support groups," says Barbara Belmont, treasurer and office administrator of the National Organization of Gay and Lesbian Scientists and Technical Professionals (NOGLSTP). "The reality is that the workplace is an extension of family for most people," she continues, "and socializing is an important aspect of team building and productivity. Another purpose is to give collective voice and personnel leverage to the often-invisible queer."

Carrie Caruso, an information services analyst at Intel and president of its GLBT employee organization (HLOBE), agrees. "No matter how much support there may be, there is still a large majority that does not accept or understand what it means to be gay, lesbian, bisexual, or transgender. Visibility and acceptance are the keys to promoting diversity and acceptance. As long as there are people being gay-bashed or being denied promotions due to their sexual orientation or gender identity, or employees that are fearful of being/shown who they are in the workplace, there is a need for GLBT groups, both within and outside of IT."

### The Numbers

But, just how much of a need exists?

Take a look at Census 2000. Gay and lesbian families live in 99.3 percent of all counties in the United States. There were 601,209 same-sex unmarried partner households in the United States in 2000 – a 314 percent increase from 1990.

However, a report published jointly in August 2001 by the Human Rights Commission (HRC) and the Urban Institute suggests that this number still represents an undercount of the gay and lesbian population.

While the HRC indicates that gay and lesbian families may have been undercounted by as much as 62 percent, the joint report is more modest. It puts the current GLBT numbers at five percent of the total population over 16 years of age – or 10,456,405 people – many of whom are well-educated.

And then, take a look at the employee groups

themselves. EAGLE has 1,000 members among 22 chapters and affiliates in 15 countries; EQUAL! doesn't keep a master list, but believes they have about 400 members in the U.S. alone; numbers from other employee groups are sparse.

*Is there anything about the home  
buying process you'd like to change?*

You can start right here. At Freddie Mac.

We're an investor-owned Fortune 500® company with an important public mission: to make mortgages less costly and more accessible so more families can own homes.

And that means things have to change. Continuously. We've already developed technology that speeds up the process and makes it more efficient. Now we're pioneering technology that will make getting a mortgage from a lender as easy as clicking a mouse.

If you want to work for a company that demands and rewards innovation (and where the dress is business casual), check out the opportunities at [freddiemac.com](http://freddiemac.com). The work you'll do here will be groundbreaking.

ways been a number of technology announcements at CA World, but this year you'll find that we'll also have a lot to do with the customer. We have our current crop of customer surveys being wrapped up; we're going to talk about them more openly with our customers. We have absolutely focused on the customer being No. 1. I have said clearly, it will make or break careers in our company. We have not used those words before.

To what do you attribute CA's long tradition of having competitive relationships with its customers? What does it stem from? No. 1, from acquisitions. They have been a great thing, and they have also been a thing that has introduced its fair share of contention. Why? You're the end user. You bought [a product from a CA competitor]. One weekend, two guys did a deal, and the next thing you know, the product that you chose over the other guy's is now owned by the other guy. Huge problems.

No. 2, we clearly have had a long-standing policy of restructuring the acquired company immediately. We have taken the big-bang approach — we cut upfront, and [we've] done. We never had a second cut in any acquisition. But, let's face it, in one day, there are hundreds of people who have left the company. Some don't have nice things to say about you; some go to work for competitors. Competitors hire them en masse to create a force to compete against CA. That's how Legend [Corp.] was created. And Legend went around and said, "We're the alternative." Well, it didn't work out that way, [and CA acquired Legend]. That's wasn't a friendly deal. It was a friendly deal — they wanted out. Platina [Techno-

ogy International Inc., which CA also acquired] was the same way — they were in trouble.

**Platinum** was an interesting case, because some Platinum customers had it written into their contracts that they would be paid up to three times the value of their contracts if Platinum was ever acquired by CA. And we didn't pay a single person — not a single one. The reason is, every customer has come to us and said that's not the basis on which they want to do business. [For] one of them, the amount was over \$75 million. Admittedly, we've had a few discussions. Not every one has been an easy thing.

What, in your view, is the concern that these companies had about an acquisition by CA in the first place? It's the momentum that people create. You have Legend going out and saying, "CA buys the products, they milk them, they don't enhance them, they fire

CA World

Users face ever-increasing complexity with the proliferation of storage technologies such as storage-area networks and the new high-speed InfiniBand connectivity standard, according to Russell Artzt, a CA co-founder and executive vice president who's now in charge of the BrightStor storage line. The new BrightStor portal will help users manage heterogeneous storage protocols (such as Fibre Channel and SCSI), processes and vendor hardware in their enterprises, Artzt said.

Sanjay Kumar, CA's president and CEO, said the effort was user-driven. "Customers want to look at storage not as MVS storage or Unix storage or [Windows] NT storage; they want to look at storage as storage," Kumar said. "Large customers said they wanted us to

everybody." Platinum comes in and says, "We're the alternative to CA, we're kinder, we're gentler, we're different." It's the perception you paint in the marketplace. And let's face it, we were not very savvy and not very smooth in how we dealt with the press and with the market.

The other dark side that people don't talk about — take, for example, Platinum. Platinum had technology they were selling for which there were no software developers working on them. Platinum had layoffs, and Legend had some cuts before we bought them — they've all had some cuts. The products were frozen. So we pick them up, we publish a nice little white paper because everybody wants to know what's happening. I point out in the white paper that the product ain't going anywhere. And people go, "That son of a bitch." This is what happens. That's a touchy subject.

Have you learned any more about the recently initiated federal investigations into CA's changes to its financial reporting practices since you informed the news media on Feb. 22, that you were unaware of the details of those investigations? We have had some dialogue with the [Securities and Exchange Commission] and the U.S. attorney's office. I'm being mindful of their need to do whatever they're going to do. But I will tell you that whatever they have going on is very preliminary. We still have not been asked for any information. The issues I think they're interested in have been issues that have been the subject of many news papers articles over time. Our job is to work with these folks, to help them understand what the issues are, and I believe they'll go away and we'll be vindicated. Customers have been very supportive.

**How difficult has this year been for**

you, having dealt with the proxy fight to control your board of directors last summer and now all of this? The proxy fight was a very difficult time for me personally, but it was a time where we had to get out and communicate more. It forced us to do things that we historically hadn't done before. We generally have not been big to get out and communicate with people and the proxy forced us to do it. So, while it was a difficult experience and a difficult time I think we learned a lot from it and we came out stronger.

This will do the same for us. There's a lot of anger in the company about being poked and prodded right now. As a management issue, we're working on channeling that anger to delivering strong results. ♦

products it has acquired over the years, said James Governess, an analyst at ILMenita Inc. in Nashua, N.H. Companies can't keep building new front ends as they add storage and security applications, said Governess, and the portal gives them a simple way of adding software without rebuilding the interface. Moreover, with the growing complexity of storage networks, storage managers need to have their own dedicated management tools, just as enterprise network software managers do, he said.

Governor suggested that one sticking point with the security portal may be that companies may not want any one individual to have central control of the security network. "I'm not sure the market is ready for that, but it's great the tools are

FRANK HAYES/FRANKLY SPEAKING

## Best Practice? Nope

**L**ET'S SAY YOU SPOT A HOUSE THAT'S ON FIRE, and you call the fire department. How long should it take the fire department to answer the phone? A few seconds? A minute? Or suppose you find a ticking bomb and call the police. How long should you have to wait on hold before you can report it? A minute? Two? Five?

How about a week?

Late last month, two security researchers proposed that when a software vendor is informed of a security hole, the vendor should have seven days just to acknowledge being notified — but not to fix or discuss it — just to say, "I got your message."

And then, according to the "best practices" proposal submitted to the Internet Engineering Task Force (IETF), the vendor should fix the problem within 30 days — that is, unless the vendor gets a "grace period extension" from the person reporting the problem.

Let's translate that into plain English: According to these best practices, vendors can spend a week pretending they haven't heard anything about a problem and then as much extra time beyond 30 days as they get by arm-twisting, cajoling, browbeating or threatening whoever reported the problem.

Sure, that person can always go public with the information and risk being stomped into a greasy spot on the pavement by a platoon of the vendor's lawyers.

Best practice? It sure sounds good for vendors — but not for anyone else.

Steve Christey of The Mitre Corp. and Chris Wysopal of @stake Inc. should know better. They're certainly not naive. Their proposal spells out the varying motives and options that both vendors and bug reporters may have (read it yourself at [www.ietf.org/internet-drafts/draft-christey-wysopal-vuln-disclosure-00.txt](http://www.ietf.org/internet-drafts/draft-christey-wysopal-vuln-disclosure-00.txt)).

So why give vendors a week just to check their mail? Especially considering that Wysopal's own company, @stake, has a policy on dealing with security holes that gives vendors just two business days to respond and two weeks to fix the problem?

Maybe Christey and Wysopal thought they needed a looser policy to make it more palatable as an IETF standard.

If that's what they were thinking, they weren't thinking it through.

A best practices document from the IETF won't be treated as the lower limit of what a vendor should do. It will be treated as the upper limit of what a vendor is required to do. That means this standard should be as tough as possible — not watered down.

Even then, a best practices standard can't be used to force a vendor to do anything. But it can be pointed to by a vendor's lawyers if they claim that a bug-finder damaged the vendor's business by going public instead of granting endless extensions.

So because the IETF is a recognized standards body, a lame set of so-called best practices actually gives vendors one more thing to hide behind if they want to drag their feet and dodge responsibility or even threaten the people who find bugs.

If that's what this best practices standard does, we're better off without it.

Too many software vendors already treat a security hole mainly as a public relations problem. They dodge, they deny, they delay — and all the while, IT people are the ones facing the consequences.

We need vendors to treat a security hole like a burning house or a time bomb that could go off at any second. In other words, like a real threat.

But that will only happen because of real pressure from customers and security experts and, yes, organizations like the IETF.

So if the IETF wants to define how to deal with security holes, let's just be sure it's lighting a fire under the people who should fix them — and not letting the house burn down. ■

## SHARK TANK

INSTALL programs for this piece of company software isn't working properly, so pilot fish calls the help desk. "Model number?" tech asks. IBM Model 6887, says fish. "I don't know what a GBBU is," says tech. "Well, on the front it says, 'IBM Personal Computer 750,'" fish reports. "Sorry, we can't help you with a personal computer; this number is only for support of company computers." Click!

WHEN NETWORK communicators fail between this big construction project in the Caribbean and engineering company's state-of-the-art headquarters, state-of-the-art communicators, state-of-the-art pilot fish to fix the problem and its fix. After days of troubleshooting with island's telecommunications providers, fish locates the point of failure: "State-of-the-art headquarters is incommunicado," he reports, "because its equipment is under four feet of water from a flood."

GENERAL FAILURE error message flashes every time user at this remote office turns on his PC, so support pilot fish sets

him to send it back to headquarters. But only the monitor arrives. Fish calls and asks, "Did you send the CPU?" Says user, "Well, the monitor was the only one showing the error."

AFTER A failed security audit, IT consultant pilot fish is going over the results with a senior systems manager. "Using 'harmless' as a password would be a bad idea," fish points out. "It's like using your date of birth for your bank card PIN." Replies manager, "What's wrong with that?"

JOB INTERVIEW WITH A consultant IT outfit goes well for this pilot fish — but then she hears from the outgoing people whose names she gives as references, all of whom were contacted by the prospective employer. "They used my name as a hook," fish says, "and then tried to sell them services!"

I WON'T SELL YOU OUT, SHARKY! You come a snazzy Shark shirt if you like title of IT we see print — or if it shows up in the daily feed at [computerworld.com/sharky](http://computerworld.com/sharky).

## The 5th Wave

# Here are three-hundred-eighty-nine-thousand-four-hundred and thirty-four

reasons why you'll thank HP for building the Superdome server. That's the number of transactions per minute it recorded, according to the latest TPC-C benchmark results. You'll appreciate how much more productive you can be with a UNIX® server that's 76% faster than IBM's highest published non-clustered TPC-C result. That's fast enough to satisfy even your most demanding IT manager. And your CFO will relish Superdome's price/performance ratio of \$21.24 per transaction.

HP's Superdome server will have you handling more applications, not only faster, but more reliably. It's designed with your always-on Internet infrastructure in mind, so you'll be working on multiple projects, across multiple platforms, with ease. Superdome is equipped to handle the Intel® Itanium® processor architecture, which HP co-developed. This breakthrough technology blends high volume with high performance, and it will keep you poised for seamless upgrades. We could give you a million more reasons. But why take our word for it? Check the Top 500 Supercomputer Site list. Infrastructure: It starts with you.

Find out how Superdome is helping Amazon.com dramatically increase their performance. Visit [www.hp.com/large/superdome](http://www.hp.com/large/superdome) for your copy of The HP Superdome Advantage resource guide. Or call 1-800-HP-ASK-ME.

HP's TPC-C benchmark of 389,434 transactions per minute was achieved on a 32-way PA-RISC Superdome running Oracle8i Database. As an OLTP system benchmark, TPC-C simulates a complete government and its related infrastructure applications and environments, other than spreadsheet computer work which don't evaluate key performance factors. For example, disk I/O, data storage, backup and recovery user activities, and communication links. Price performance of \$21.24/btmfc. TPC-C is a copyright of the Transaction Processing Performance Council. Further TPC-C information is available from <http://www.tpc.org>. IBM's TPC-C result, available 4/15/2001, is 220,807 transactions per minute running on a IBM P690 running Oracle 8i, with price performance of \$324.8/btmfc. Oracle 8i is a registered trademark of Oracle Corporation. Oracle 8i is a registered trademark of Oracle Corporation. IBM is a registered trademark of International Business Machines Corporation. UNIX is a registered trademark of The Open Group. Itanium is a trademark of Hewlett-Packard Company. It is a registered trademark of Hewlett-Packard Company. All other products mentioned in this document are trademarks or registered trademarks of their respective companies. Test system availability date: May 15, 2002. Hardware available now. Lead time: 4-8 weeks for delivery. ©2002 Hewlett-Packard Company. All rights reserved.

# THE WORLD'S MOST CRITICAL APPLICATIONS, RUN ON CACHÉ

SO RELIABLE,  
IT'S THE  
LEADING  
DATABASE  
IN HEALTHCARE

More hospitals around the world are running their "life-or-death" applications on Caché than on any other database system. With proven reliability like this, you should consider Caché for your critical applications.

With its lightning speed and massive scalability, the performance of Caché makes it a perfect match for any enterprise, in any industry, with a requirement for fast transaction-processing applications capable of scaling to tens of thousands of users.

Caché uniquely combines robust object and relational technologies, coupled to a multi-dimensional data engine. Plus, it includes a rapid Web application development environment.

Caché is backed by 24x7 support from InterSystems - a leader in high performance databases for 23 years, with 4,000,000 users worldwide in healthcare, financial services and other industries.

Make Applications Faster

Download Caché for free or request it on CD at [www.interSystems.com](http://www.interSystems.com)

\* InterSystems Database technology is used by Amritsar, India; Johns Hopkins, Kennedy Space Center, Paris Webber, Pepe Côte, Prudential Insurance Co., Shell, U.S. Army, World Bank and other successful enterprises.
